Principal Investigators

Center for Archaeological Research
The University of Texas at San Antonio
Archaeological Survey Report, No. 300

The following information is provided in accordance with the General Rules of Practice and Procedure, Chapter 41.11 (Investigative Reports), Texas Antiquities Committee:

1. Type of investigation: Class III archaeological survey

2. Project name: Twin Buttes Archaeological Survey

3. County: Tom Green

4. Principal investigator(s): Robert J. Hard and C. Britt Bousman

5. Name and location of sponsoring agency: Bureau of Reclamation, Oklahoma City Field Office, 4149 Highline Blvd., Suite 200, Oklahoma City, OK 73108

6. Texas Antiquities Permit No.: N/A

7. Published by the Center for Archaeological Research, The University of Texas at San Antonio, 6900 N. Loop 1604 W., San Antonio, Texas 78249-0658, 2001

A list of publications offered by the Center for Archaeological Research is available. Call (210) 458-4378; write to the Center for Archaeological Research, The University of Texas at San Antonio, 6900 N. Loop 1604 W., San Antonio, Texas 78249-0658; e-mail to car@lonestar.utsa.edu; or visit CAR's web site at http://car.utsa.edu.

Twin Buttes Archaeological Project

Shovel and Auger Test Data

The following definitions, explanations and codes were used during the analysis of cultural material recovered from shovel and auger tests:

Artifact Type

1. Flakes. All utilized flakes and/or debris which cannot be classified as a core, tool, or ground stone. Flakes and debris do not necessarily have to have a clearly distinguishable ventral and dorsal surface — pieces often referred to as "chunks" or "angular debris" are of this type.

2. Cores. Cores are defined as any parent block from which flakes have been removed. This category does not, however, include tools. Cores must have at least three negative bulbs and cannot have a positive bulb; if a positive bulb is present in this classification, it is a flake and not a core. "Flake cores" were not a category for the purposes of this analysis.

3. Tested Cobbles. A tested cobble must have one or two negative bulbs present; no positive bulb.

4. Bifaces. This type includes any item on which both faces have flake scars that cover at least 1/3 of the face and have been removed in a systematic manner. This class includes points, preforms, and blanks. Pieces elsewhere called "bifacial cores" were considered as cores for the purposes of this analysis, and functional use was not considered.

5. Unifaces. This type includes any item on which only one face has systematically removed flakes that cover at least 1/3 of that face. In some cases, unifacial retouch may be accompanied by use and retouch; in this case the piece was still classified as a uniface.

6. Retouched/Utilized Flakes. This type includes any item on which flakes have been systematically removed from an edge, but which does not qualify as a biface or uniface.

7. Other. This includes any specimen not covered above such as ground stone, hammerstone, etc. Their identity would be specified in the comments section.

Maximum Length

This is the maximum length of an artifact, recorded in 1-cm units. All artifacts are subject to this category (0 to 1 cm = 1; 1 to 2 cm = 2; 2 to 3 cm = 3....etc.).

Maximum Thickness

This is the maximum thickness of an artifact, recorded in 1-cm units as shown above for Maximum Length.

Cortex

This is the percentage of cortex on the dorsal surface (including the platform) of all items with the exception of cores, tested cobbles, and the "other" artifact type (see notes below). The following groupings were used:

0% = No Cortex	Code as 0
1-25% Cortex	Code as 12
26-50% Cortex	Code as 38
51-75% Cortex	Code as 62
76-99% Cortex	Code as 88
100% Cortex	Code as 100

On Cores, tested cobbles, and "other" types the following codes were used:

No Cortex	Code as 0
Less than 51% Cortex	Code as 25
More than 50% Cortex	Code as 75

Material Color

The vast majority of the material was coded as 1, which is either gray, brown, or blue-gray. Codes 2 and 4 are white and/or pale white. Code 3 is either pinkish or red; often heat-treated. Code 9 is any other color.

Fire Cracked Rock

If present, the type of rock is noted.

Mussel Shell

Only presence or absence is noted.

Other/Remarks

The presence or absence of other cultural material, and/or remarks is noted.

Appendix C:
Twin Buttes Archaeological Project

Excavation Summary

Introduction

In addition to shovel testing, four previously unrecorded sites were selected for further testing. Two 1-m^2 test units were excavated at 41TG378 to evaluate the integrity of an early Paleoindian component; one unit each at 41TG389 and 41TG410 to evaluate the integrity of possible Late Archaic components; and one unit at 41TG443 to investigate the remains of a probable historic dugout. This appendix provides the results of those investigations. For a detailed description of each site and the results of preliminary shovel testing and surface observations, the reader is referred to Appendices A, B, and D for more information about the three prehistoric sites, and to Chapter 11 for more information about 41TG443.

Methods

All test excavation units were 1 m^2 except for the single unit at 41TG443 (Historic component) which was excavated in feet and inches. Excavation was accomplished with trowels, picks and brushes in arbitrary 10 cm intervals in the prehistoric components, but by stratigraphic levels in the historic component. All sediments were screened through ¼-inch wire mesh. Cultural material other than special samples were placed in paper bags labeled with the site number, provenience, date, and name of excavator(s). Charcoal samples were placed in aluminum foil, and flotation samples were placed in plastic bags. Photographs using color print and slide film were taken. Photographs were recorded on standard photo logs in the field. In addition to photographing general excavation activities, particular attention was given to features, profiles, and plan views.

Artifacts collected in the field were brought to the Center for Archaeological Research (CAR) laboratory on the UTSA campus. Processing of cultural material recovered began with washing and sorting into categories. Individual lithics were sorted by a size chart and counted. The data were entered on a spreadsheet to facilitate distribution analysis. Spreadsheets were designed to sum the various types of artifacts and to calculate relative percentages.

Acid-free labels were placed in all artifact archival-quality bags for curation. Each bag was labeled with a provenience. Stone tools were labeled with permanent ink and covered by a clear coat of acrylic. Artifact bags were separated by class and stored in acid-free boxes. Boxes were labeled with standard labels.

A single flotation sample of 15 liters of sediments was collected from Feature 1, 41TG389 and transported back to San Antonio for processing at the CAR lab. The sediments were poured into plastic buckets, clean water added, and the mixture gently stirred by hand to bring the light fraction to the water's surface. The floated material was then gently skimmed off the surface or poured through a tightly woven chiffon cloth fitted into a fine wire mesh kitchen

colander. The cloth with the light fraction on it was then removed and allowed to dry indoors. After drying, the light fraction was poured from the chiffon cloth through graduated nesting screen sizes of 2 mm, 1 mm, and 0.5 mm respectively. A catchment pan was placed on the very bottom to catch any remains finer than 0.5 mm. Any examination of the processed light fractions was done under sterile conditions. The light fraction was then placed in paper letter envelopes and sent to Dr. Philip Dering of Texas A&M University.

All fire-cracked rock from Feature 1, 41TG389 was collected, brought back to the lab, and was discarded after analysis. No wood charcoal samples were recovered from any of the unit excavations.

Field notes, forms, photographs, and drawings were placed in labeled notebooks. Photographs, slides, and negatives were placed in archival-quality sleeves. All notebooks were stored in acid-free boxes. A copy of the site report and all computer disks pertaining to the investigation of the excavations are stored in an archival box and curated with the field notes and documents. Artifacts, notes, documents, and photographs are permanently housed at the Center for Archaeological Research on The University of Texas at San Antonio campus.

CAR collected 11 core samples from fire-cracked sandstone cobbles in a single feature using a portable rock drill. The cores were oriented according to established paleomagnetic techniques by means of a compass mounted on a goniometer. The elevation of each sample relative to the unit datum was recorded and all samples were identified on a planview map. All samples were analyzed in the Paleomagnetic Laboratory, Department of Geological Sciences, The University of Texas at Austin. All samples were subjected to progressive thermal demagnetization in 50°C steps from 150°C to 500°C. The characteristic directions of magnetization were obtained after inspection of the data in orthogonal vector projections and principal component analysis (e.g., Butler 1992).

Samples for magnetic susceptibility studies were collected in four vertical profiles from three excavation units. For each sample column, a 10-cm vertical face of the unit wall was scraped horizontally with a clean trowel to provide a fresh exposure and avoid possible contamination in the open unit. A tape measure was placed vertically on the trench wall and a >2 cm^3 sample of sediment was taken with a trowel every 3 cm down the face of the unit. The trowel was wiped clean after each sample was taken in order to obtain uncontaminated samples. Samples were collected in plastic bags which were labeled with provenience information. In the laboratory, the samples were placed in 2-cm^3 plastic cubes for measurement in a Bartington (MS2) Magnetic Susceptibility Meter.

Sites Excavated

41TG378

Discussion

A Clovis point base with probable associated debitage, and possibly associated hearth features were found on the surface during the initial survey. Limited shovel testing indicated the potential for buried, intact deposits and thus two 1-m^2 units were excavated at the site. In addition to the two test units, soil susceptibility samples were collected and processed at the Paleomagnetism Laboratory, The University of Texas at Austin (see Appendix J).

Results and Analysis

Test Unit 1 was placed at N992 E991, near the discovery of a Clovis point base on the surface (Figure A-20), and was excavated to a depth of 1.1 m. No prehistoric artifacts were recovered. The recovery of modern glass and a

fishing weight in the upper 20 cm provided evidence of recent disturbance. The results of a vertical soil susceptibility column analysis taken from the north wall provided no indication of a buried occupation surface.

Test Unit 2 was placed upslope from Test Unit 1, at N1028 E1012. One incomplete flake, one utilized flake, and an indeterminate piece of chert debitage were found in the upper 10 cm. However, modern glass found in the same level provided evidence of recent disturbance. Although two additional incomplete flakes and an indeterminate piece of chert were found between 10–20 cm below the surface, they were lying just above sloping bedrock. Excavation was terminated 15–40 cm below the surface on the sloping sandstone bedrock.

Because of the apparent disturbed nature of the flakes found in Unit 2, the absence of cultural material in Unit 1, the lack of evidence for a buried soil in the magnetic susceptibility results (Appendix J), and the geomorphological investigations which indicate that the site is located on a deflated hill slope (see Appendix I), no further work is recommended.

41TG389

Discussion

During the shovel testing phase a Late Archaic-like dart point was recovered from Shovel Test 1 between 0–10 cm below the surface, and all six shovel tests contained artifacts between 0–30 cm. Fire-cracked rock was found in Shovel Test 3 and it also yielded a higher density of flakes relative to the other shovel tests (see Appendix B), thus a single 1-m^2 test unit (N988 E985) was placed nearby (Figure A-31). Archaeomagnetic samples were collected from a fire-cracked rock feature, and soil susceptibility column samples were collected from the east and west walls of the unit.

Results and Analysis

Vertical Distribution of Cultural Remains

A single, complete, ovate-shaped biface measuring 52.61 mm long, 30.50 mm wide, and 12.43 mm thick was found between 30–40 cm below the surface, just above sloping bedrock. It was made from a cobble of fine-grained chert with a few inclusions, and had been heat-treated. It showed evidence of having been reduced to a middle stage of reduction. In addition to the biface, a total of 684 flakes, and two potlids, were also recovered from the single excavation unit. The raw data from the analysis of flakes can be found in Table C-1. Table C-1 provides a summary of mean flake length by depth compared with the Holocene eolian undifferentiated soils recorded by Nordt (see Appendix I).

Table C-1. Vertical distribution of flakes and soils from 41TG389

Depth (cm bs)	∞ Flake Length (mm)	Soil Description
0-6	**19.45** (n=101)	Fine sandy loam, friable, moderate, medium subangular blocky
6-10	18.41 (n=238)	Same
10-20	17.24 (n=196)	Same, with carbonate clasts
20-30	**14.63** (n=98)	Same, with carbonate clasts
30-40	**16.20** (n=20)	Sandy clay loam, firm, moderate, medium, coarse subangular blocky
40-50	**15.02** (n=24)	Same
50-60	**18.09** (n=7)	Carbonate cemented channel gravels at 59 cm

Vertical movement of artifacts through layered sediment and soil packages due to size sorting can be problematic in sandy soils (e.g., Stevenson 1991; Vierra 1998). Basically, larger artifacts tend to remain relatively in place, while smaller artifacts tend to move downward commensurate with their decreasing size. Thus, when examined vertically we would expect that larger artifacts represent an occupation zone, with the increasingly smaller artifacts working their way downward below the occupation zone. At other sites in south and central Texas, Vierra (1998), Nickels et al. (1998:91–92), and Nickels (2000) have examined the vertical movement of artifacts through soil horizons, and they have successfully correlated the data with occupation levels.

Table C-1 suggests the presence of human occupation between 0–6 cm below the surface, within the friable sandy loam. The decreasing mean flake length to 30 cm below the surface implies size sorting. Nordt (Appendix I) has identified a clear, smooth lower boundary to the friable sandy loam about 29 cm below the surface, with a transition to a firm, sandy clay loam, and the increase in mean flake length to 16.2 mm between 30–40 cm corroborates the implication of a possible occupation surface. Finally, although the numbers are much smaller, the increased mean length in the table also suggest a possible occupation zone between 50–60 cm.

Feature 1

Feature 1 was a cluster of fire-cracked sandstone cobbles found between 6–17 cm below the surface, concentrated in the southeastern portion of the unit. Chert debitage and a few mussel shell fragments were found in association, but no charcoal. Eleven core samples drilled and analyzed indicated that the feature was not *in situ*; presumably the rocks represent discard from a perhaps larger feature to the southeast.

The limited data available from both the shovel tests and single excavation unit indicate that the site still maintains a high degree of integrity and with additional investigations there is a high probability of finding buried, intact cultural features and discrete zones which have the potential to provide valuable information on site formation processes, subsistence, and settlement patterns.

41TG410

Discussion

During initial testing, a Frio (Late Archaic) dart point was found in Shovel Test 3 between 40–50 cm below the surface (see Appendix F), and a single radiocarbon assay obtained from charcoal found between 30–40 cm below the surface in Shovel Test 2 yielded a date of 460±40 BP (see Appendix H). A single 1-m^2 test unit (N997 E992) was placed adjacent to the shovel test (Figure A-53) to investigate the possibility of intact features and other cultural material in association with the point. The 1-m^2 test unit was excavated to 1 m below the surface.

Results and Analysis

A total of ten flakes were recovered from the unit, but no fire-cracked rock or other cultural material. All of the flakes were made from chert and none exhibited evidence of heat treating; their attributes are shown in Table C-2. The sample size is extremely small and thus any attempted analysis is problematic. However, the number of flakes with multi-faceted platforms, no cortex, and multiple dorsal scars suggests that middle to late stage bifacial reduction activities were occurring at the site. The presence of a rejuvenation flake and an expedient, utilized flake suggest at least a short-term domestic occupation during which some food processing may have occurred. The continuum of recovered flakes between 30–90 cm did not provide a firm indication of distinct, stratified occupation levels, but does suggest that the site may have been occupied either continuously or intermittently for an extended period of time.

Table C-2. Attributes of flakes recovered from 41TG410

Depth (cm bs)	Complete?	Length (mm)	Thickness (mm)	# Platform Facets	Cortex %	# Dorsal Scars	Comments
10-20	No	11.53	3.26	3	100	0	
30-40	No	8.81	5.29	0	0	9	
30-40	No	15.79	3.40	0	90	1	
30-40	No	9.42	1.75	1	0	2	Rejuvination
40-50	No	17.32	5.20	0	90	1	
40-50	Yes	24.06	3.56	4	10	2	
40-50	No	31.36	6.13	1	1	4	Utilized
50-60	No	16.59	2.01	0	0	1	
60-70	Yes	28.71	5.24	4	0	3	
80-90	Yes	25.73	2.52	2	0	3	

The limited data available from both the shovel tests and single excavation unit indicate that the site still maintains a high degree of integrity and with additional investigations there is a high probability of finding buried, intact cultural features and discrete zones which have the potential to provide valuable information on site formation processes, subsistence, and settlement patterns.

41TG443

Discussion

A noticeable rectangular depression with a rock alignment in front on the southern portion of the site suggested a possible cellar or dugout had been excavated into the shallow sediments just off the edge of the limestone shelf. A single shovel test within the depression revealed what appeared to be a wooden floor or a collapsed roof of a possible dugout structure. A single 1-m^2 test unit was placed near the rock alignment at what was surmised to be the entryway on the southern end of the structure (Figure 11-9). The unit was excavated to two inches below the wood layer, into sterile silty loam.

Results and Analysis

Artifacts collected from the single excavation unit include: From level 1 (0–4 inches), two clear glass sherds that probably date after the 1930s (Kendrick 1967:24; Munsey 1970:55); from Level 3 (5–6 inches), one small whiteware sherd, and a metal wire handle that may have been attached to a pail, and; from Level 4 (6–7 inches), five heavily corroded and unidentifiable metal fragments.

Based on the thickness and paste, the ceramic sherd appears to be whiteware from either a plate or saucer. The whiteware attributes along with a flowing blue pattern date its usage ca. 1880–1900 (Blake and Freeman 1998:18). Based on its context with other artifacts and within the probable dugout at the site, but without a maker's mark or more of the pattern on the sherd, this time frame is presumed (see Chapter 11).

The research value of this site is considered high. This site may represent one of the earliest historic occupations in the San Angelo/Twin Buttes area. The presence of a dugout that may still have an intact floor is rare. The presence of flaked glass is uncommon, but appears to be a recurring theme, with flaked glass found also at 41TG437 and 41TG445. Without further testing and the recovery of diagnostic stone tools or means of absolute dating, the possibility that the lithic assemblage at the site may be historic or protohistoric cannot be ruled out.

Surface Observation Data

This appendix presents information on the surface observation area (SOA) procedure. As discussed in Chapter 9, Volume 1, the goal of the SOA effort was to generate quantitative data on artifacts during the essentially non-collection survey. A series of elements were noted on each of the surface items. The attributes had to be sufficiently general such that a variety of different individuals with different backgrounds in chipped stone analysis and different levels of training could consistently record the attributes. In addition, the process had to be done quickly, maximizing the number of items recorded and the number of areas that could be investigated. Consequently, common reduction terms such as "biface thinning flake" and "preform" were avoided as the application of a specific set of criteria to several thousand flakes would have taken significant time and a substantial amount of inconsistency would certainly be introduced during the recording procedure. The attributes which were eventually selected were pared down from a more detailed list after evaluating initial tests for consistency of recording between individuals. The attributes selected included artifact types defined primarily by morphological attributes (e.g., flake, biface, uniface, retouched and/or utilized flake), maximum length and width of the artifact in 1 cm intervals, percentage of cortex on chipped stone items in ordinal groups (i.e., 0%, 1–25%, 26–50%, 51–75%, 76–99%, 100%), and material type. Forms and definitions of specific attributes used during the surface observation are presented in Appendix K.

Site and Area Selection

Sites were selected for inclusion in the sample based on both surface density and location. As our concern was generating quantitative data, those sites which were essentially defined in cutbanks or those sites noted as having few surface artifacts were generally not included in the sample. In addition, we wanted to acquire data from throughout the project area. We recorded artifacts from a total of 131 separate surface observation areas from 97 different sites. As demonstrated in Chapter 9, Figure 9-1, Volume 1, the sites blanket all areas of Twin Buttes Reservoir.

Once a site was selected as a candidate for one or more surface observation areas, a quick inspection of the surface was made with special attention to areas of differential density and exposure. Based on this inspection, one or more areas were arbitrarily selected for observation. In areas of high density, the usual procedure was to establish a circle with a three meter radius as the collection area. With lower densities, areas of various sizes and configurations were established. The boundaries of these areas were then mapped using a GPS unit. In several cases (e.g., 41TG465), the entire site was inventoried.

Once established, closely spaced transects were slowly made across the area by two to three person crews. All artifacts within a SOA were identified by the use of pin flags. Red pin flags were used for all debitage, and all tools and cores were marked with yellow pin flags. Artifacts were then recorded using the form and definitions outlined in Appendix K. Note that Dr. Raymond Mauldin recorded all tools and cores, in order to reduce the potential impact of different recorders on this category.

Table Explanation

The following table presents information on the 131 separate SOA's. A total of 18 different columns are presented. Each of these fields is discussed below. Definitions for cores, bifaces, unifaces, tested cobbles, and utilized/retouched flakes can be found in Appendix K.

41TG#: State of Texas archaeological trinomial number.

SOA #: Number assigned to each SOA within the site.

Exposure (Exp.) Level: The exposure designation was made in the field by Dr. Raymond Mauldin. A designation of 1 suggests that the surface was not exposed, being characterized either by vegetation that obscured artifacts or by what appeared to be some buildup of sediment. A designation of 2 was assigned to those areas that had both little or no vegetation and evidence of some erosion. These cases frequently were shorelines consisting of extensive gravel deposits, exposed conglomerate, ridge tops with little deposition, and areas with bedrock exposed on the surface.

Tert. Flakes: Number of flakes without cortex observed within the SOA.

Secon. Flakes: Number of flakes with more than 1% and less than 50% cortex observed in the SOA.

Prim. Flakes: Number of flakes with more than 50% cortex observed in the SOA.

Cores with: Number of cores with cortex present in the SOA.

Tested Cobbles: Number of tested cobbles observed in the SOA.

Uniface with: Number of unifaces with cortex present.

Utilized with: Number of utilized or retouched flakes with cortex observed in the SOA.

Cores without: Number of cores without cortex present in the SOA.

Biface with: Number of bifaces with cortex observed in the SOA.

Utilized without: Number of utilized or retouched flakes without cortex observed in the SOA.

Biface without: Number of bifaces without cortex observed in the SOA.

Uniface without: Number of unifaces without cortex present

Metate Frag.: Number of metates, including any metate fragments, observed in the SOA.

Mano: Number of manos, including any fragments, observed in the SOA.

Hammer Stone: Number of hammer stones observed in SOA.

Appendix E:
Twin Buttes Archaeological Project

Data on all Bifaces Observed and/or Collected

Table E-1 provides data on 294 bifaces observed and/or collected on the Twin Buttes survey. Ten different columns are present.

41TG#: State of Texas archaeological site trinomial. Isolated items are designated as 0.

Complete Length: 1 = length measurement is complete; 0 = length measurement is partial.

Length cm.: Maximum length in cm.

Complete Width: 1 = width measurement is complete; 0 = width measurement is partial.

Width cm.: Maximum width in cm.

Complete Thickness: 1 = thickness measurement is complete; 0 = thickness measurement is partial.

Thickness cm.: Maximum thickness in cm.

Biface Shape: 0 = irregular; 1 = round to oval in outline; 3 = diamond shaped; 4 = leaf shaped; 5 = other; 8 = projectile point.

Cortex Present: 0 = no cortex; 1 = less than 50% cortex cover; 2 = more than 50% cortex cover.

Material Types: The vast majority of the material was coded as 1 – which is either gray, brown, or blue-gray. Codes 2 and 4 are white and/or pale white. Code 3 is either pinkish or red; often heat-treated. Code 9 is any other color.

Table E-1. Data on Bifaces Observed and/or Collected During the Twin Buttes Survey

Twin Buttes Archaeological Project

Unique Items

Chipped stone Unique Items (UIs) discussed in the text are illustrated on the following pages. The diagnostics are arranged in chronological order, from Paleoindian through Late Prehistoric, followed by non-diagnostic tools.

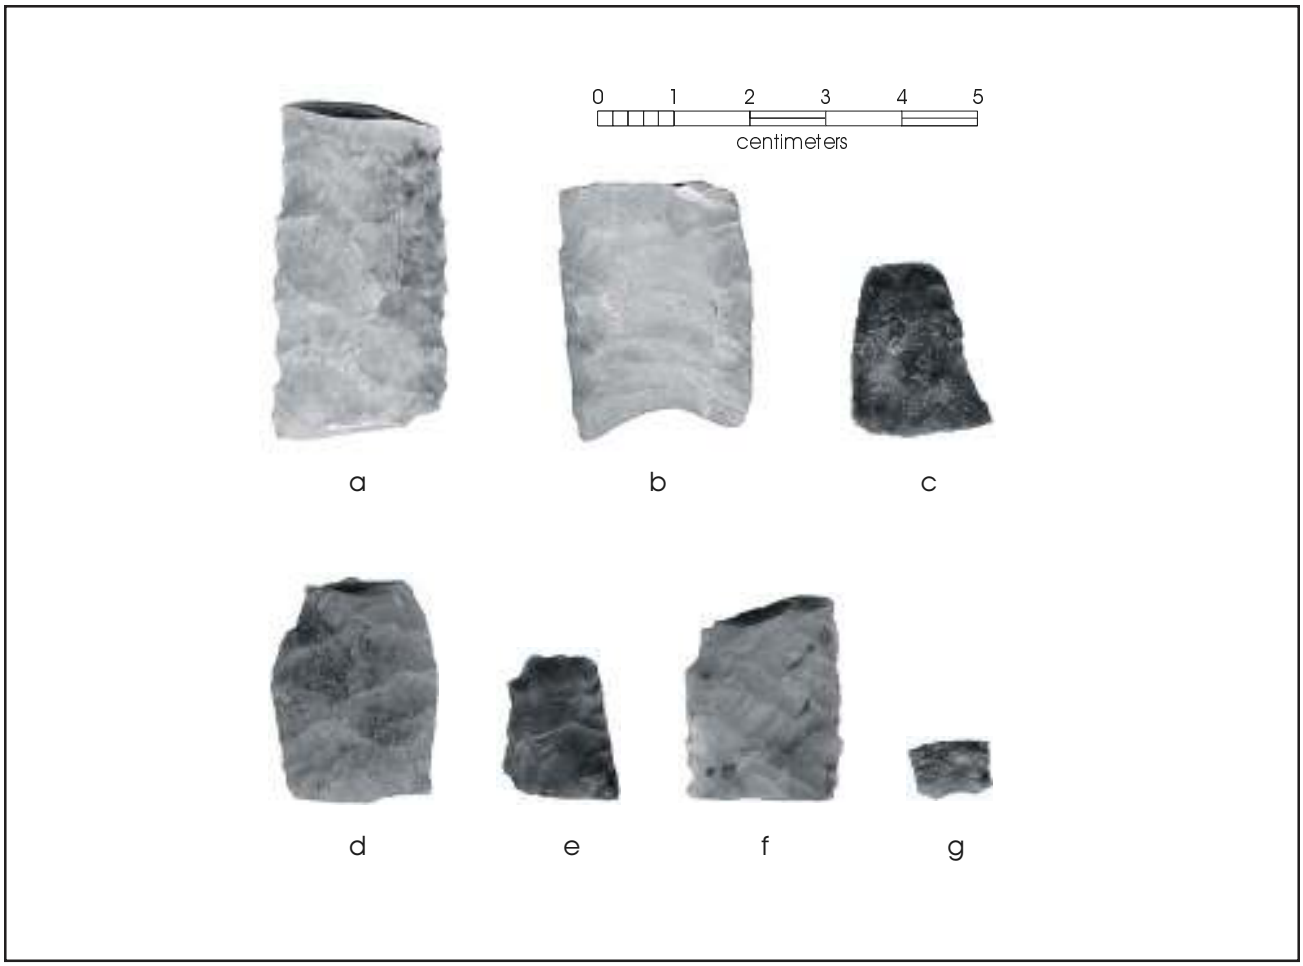

Figure F-1. *Paleoindian points: (a) 41TG370, UI-7, Lanceolate; (b) 41TG378, UI-12, Clovis; (c) 41TG109, UI-66, Angostura; (d) 41TG246, UI-35, Angostura-like; (e) 41TG523, UI-67, Late Paleo-like; (f) 41TG252, UI-60, Plainview-like; (g) 41TG534, UI-303, Barber or Golondrina-like.*

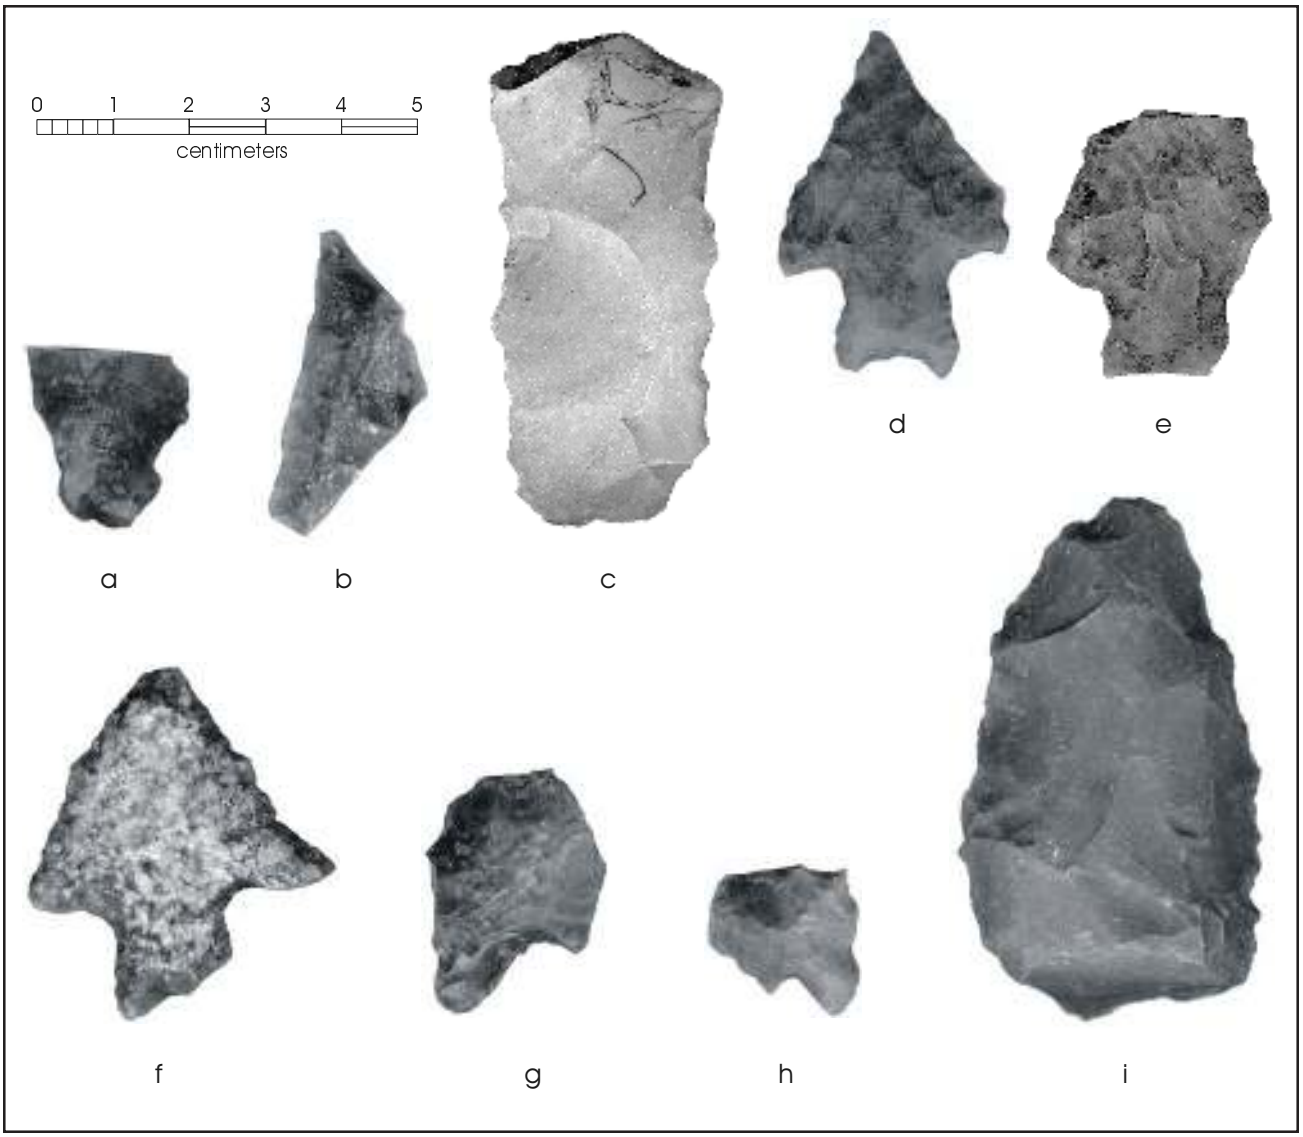

Figure F-2. *Early Archaic points and tools: (a) 41TG362, UI-41, Uvalde-like; (b) 41TG373, UI-10, Early Triangular; (c) 41TG388, UI-20, Guadalupe Adze; (d) 41TG388, UI-70, Uvalde; (e) 41TG390, UI-21, Bandy-like; (f) 41TG424, UI-29, Martindale or Bandy; (g) 41TG449, UI-56, Baker-like; (h) 41TG247, UI-57, Martindale-like; (i) 41TG244, UI-319, Guadalupe Adze.*

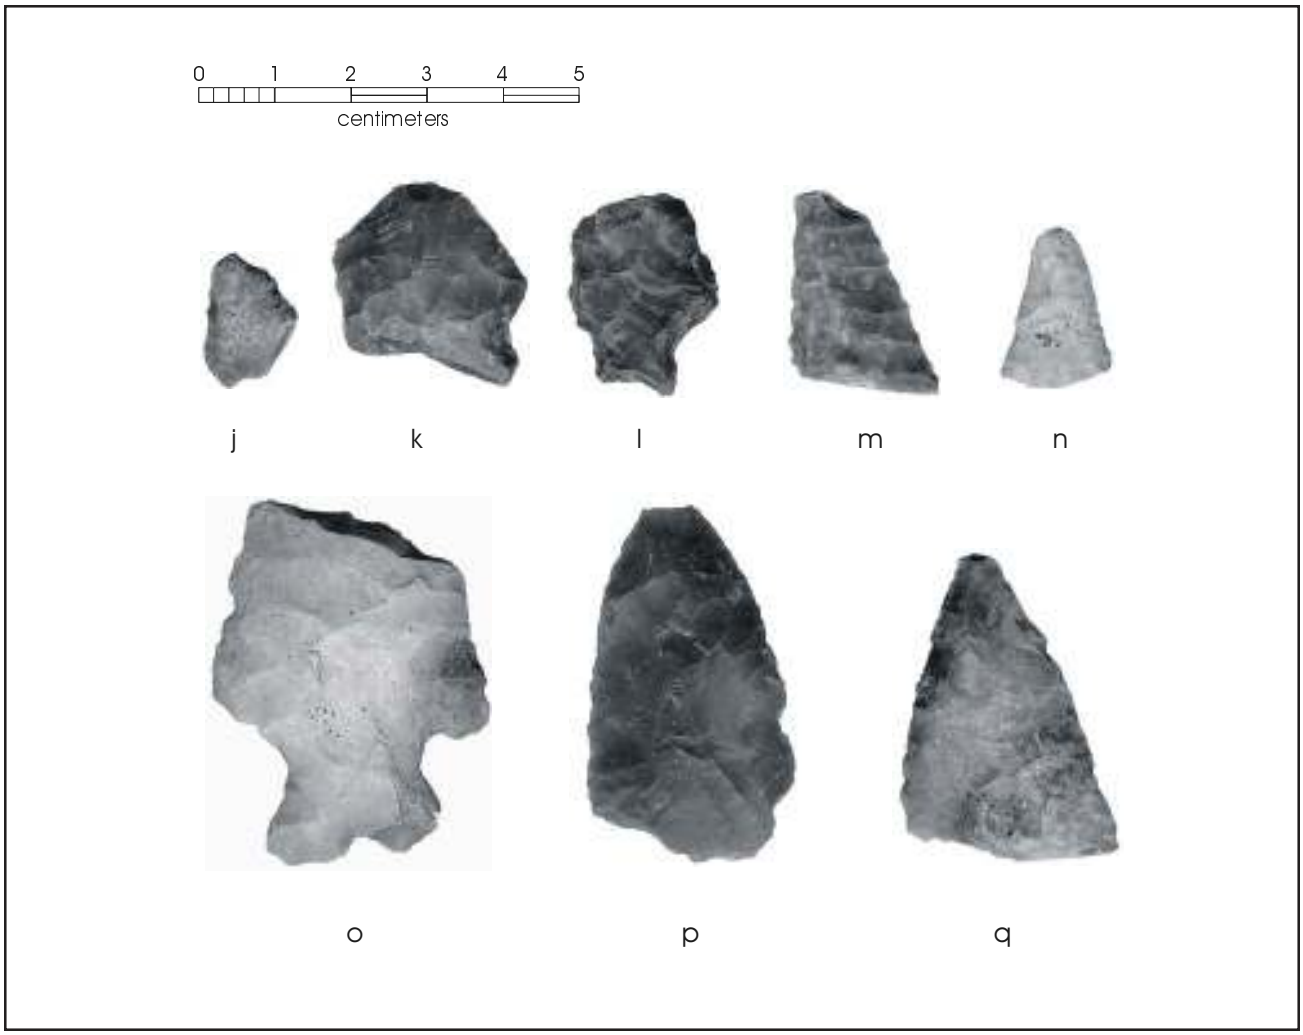

Figure F-2 (continued). *Early Archaic points and tools: (j) 41TG534, UI-308, Early Triangular-like; (k) 41TG523, UI-64, Gower-like; (l) 41TG530, UI-58, Val Verde; (m) 41TG369, UI-6, point medial fragment; (n) 41TG504, UI-305, Early Triangular [possibly Late Archaic Tortugas]; (o) 41TG529, UI-322, Martindale [possibly Late Archaic Frio]; (p) isolated find, UI-23, Early Triangular [possibly Late Archaic Tortugas]; (q) 41TG526, UI-47, morphologically Early Archaic.*

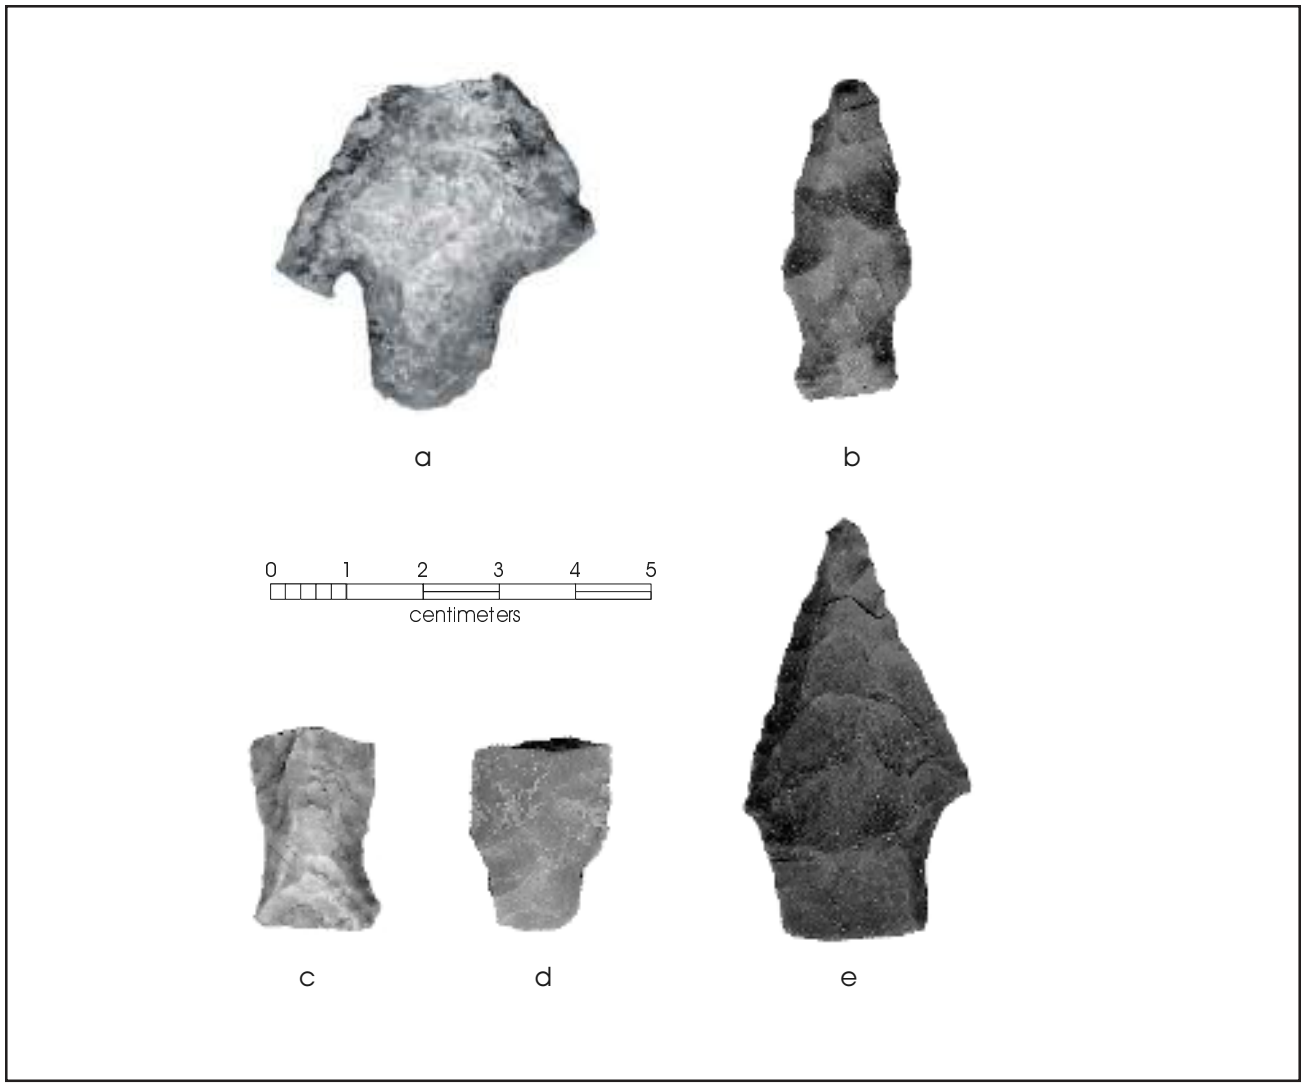

Figure F-3. *Middle Archaic points: (a) 41TG364, UI-39, Andice; (b) 41TG488, UI-37, Pandale; (c) 41TG506, UI-302, Pandale; (d) 41TG530, UI-63, Pandale; (e) isolated find, UI-34, Nolan.*

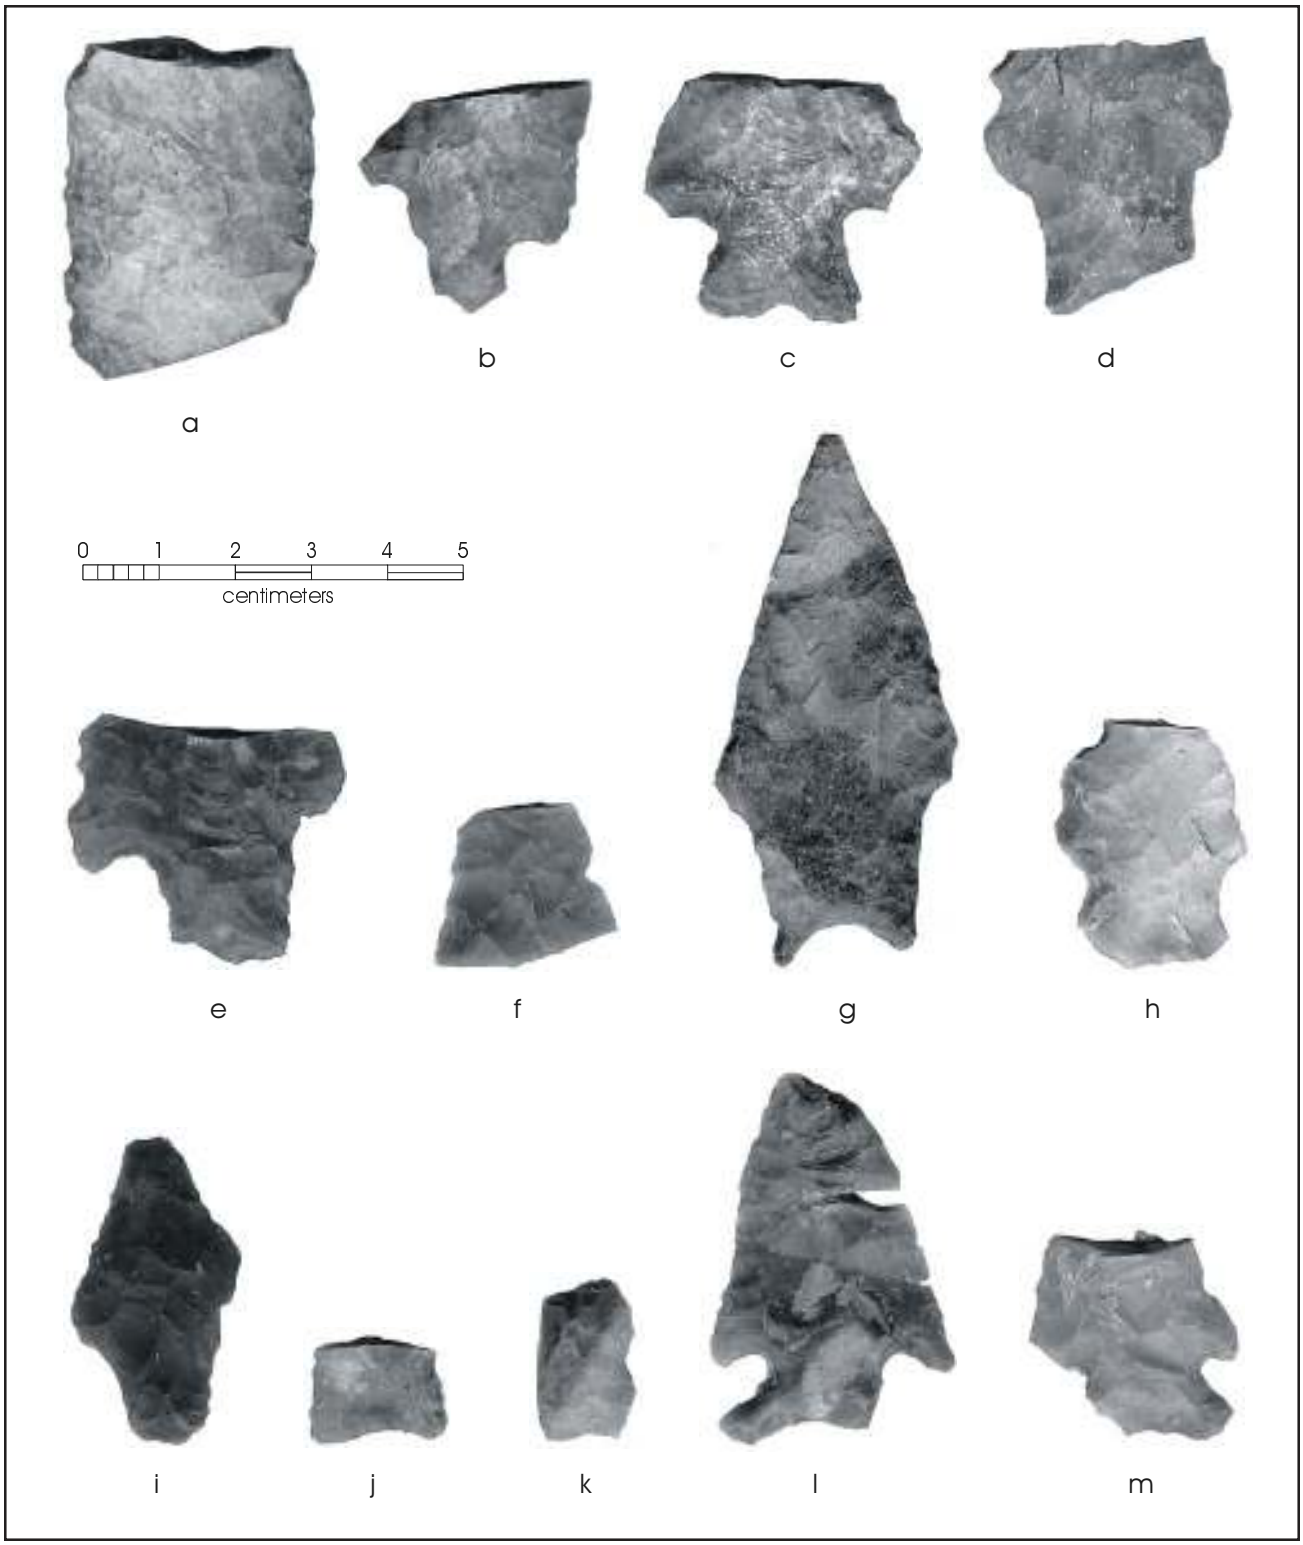

Figure F-4. *Late Archaic points: (a) 41TG362, UI-1, Marcos/Marshall-like; (b) 41TG418, UI-26, Frio-like; (c) 41TG105, UI-40, Marshall; (d) 41TG365, UI-2, Marcos-Marshall-like; (e) 41TG367, UI-3, Marshall or Williams-like; (f) 41TG367, UI-5, morphologically Late Archaic; (g) 41TG382, UI-18, Pedernales; (h) 41TG391, UI-22, Trinity-like; (i) 41TG404, UI-49, Langtry; (j) 41TG405, UI-50, Marshall-like; (k) 41TG409, UI-65, Marcos-like; (l) 41TG410, UI-45, Frio-like; (m) 41TG412, UI-24, Ensor or Frio.*

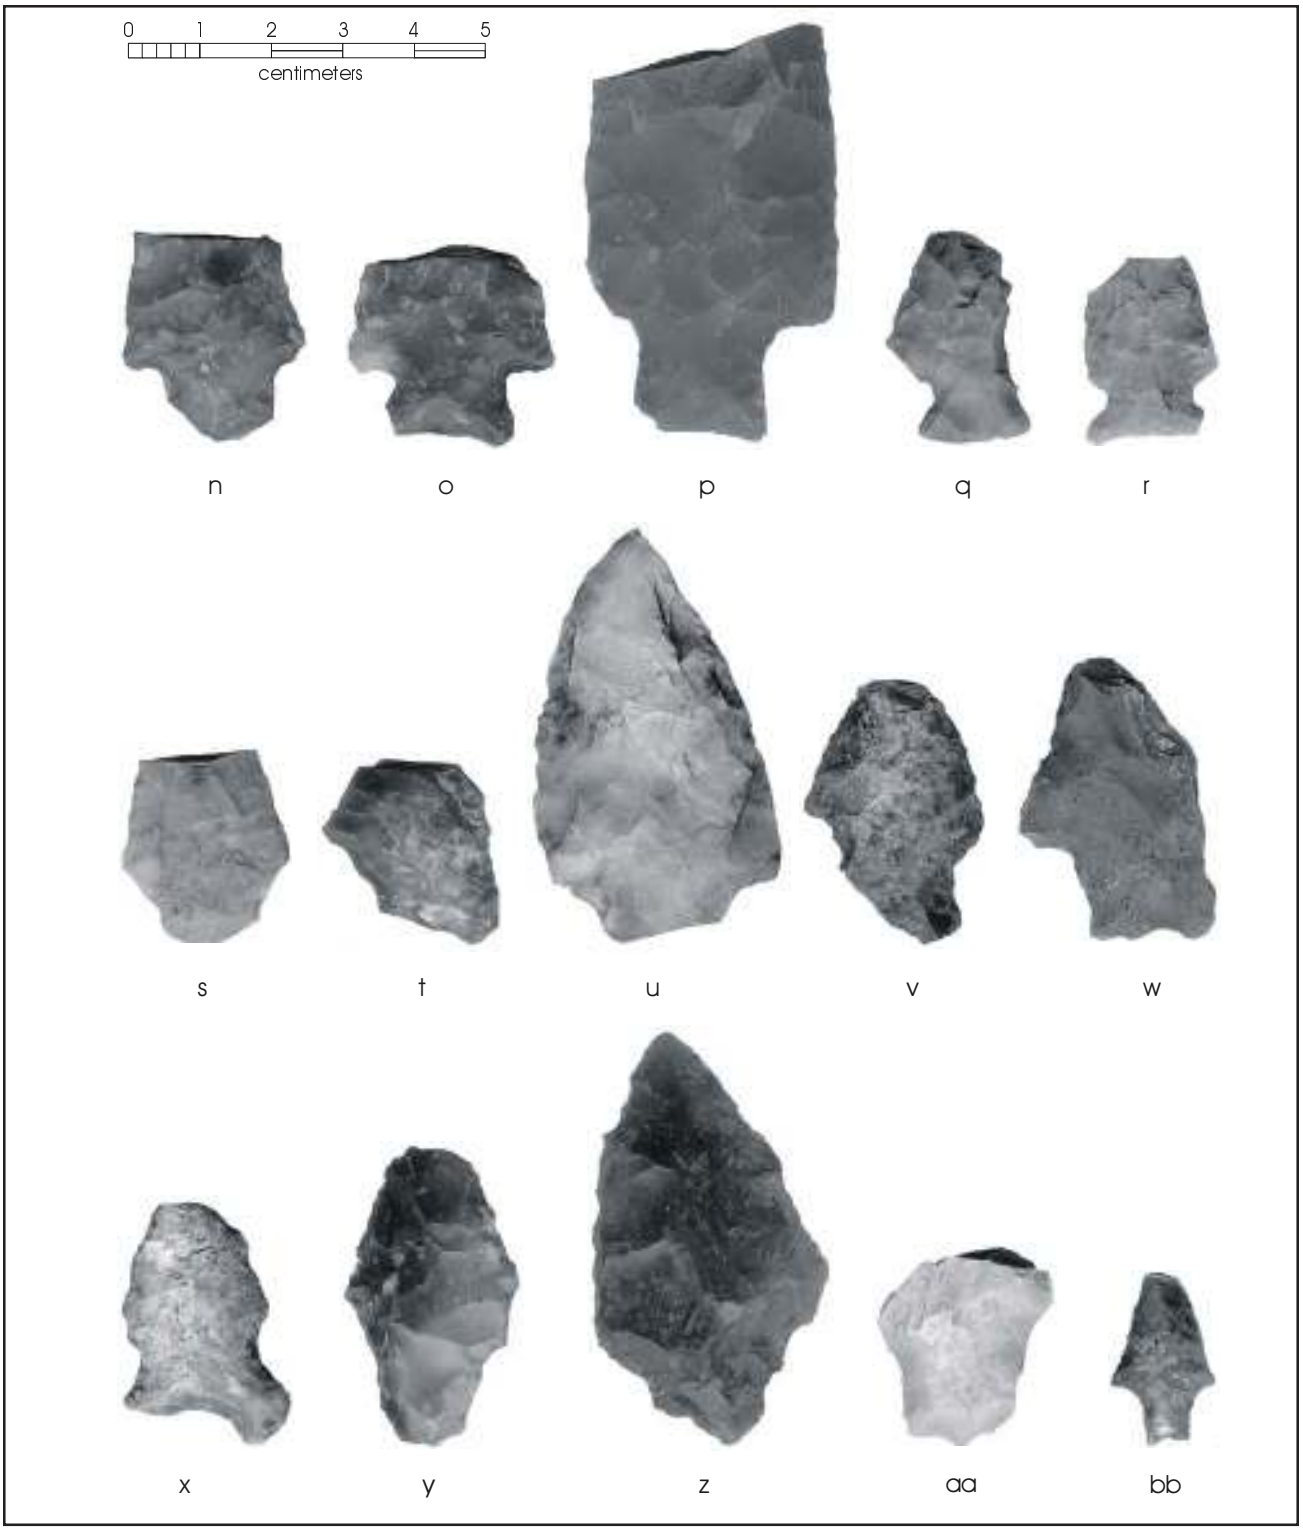

Figure F-5. *Late Archaic points (continued): (n) 41TG412, UI-25, morphologically Late Archaic; (o) 41TG412, UI-68, Marshall; (p) 41TG424, UI-72, Marshall-like; (q) 41TG427, UI-28, Ensor-like; (r) 41TG427, UI-53, Fairland; (s) 41TG427, UI-54, morphologically Late Archaic; (t) 41TG110, UI-32, Frio-like; (u) 41TG440, UI-31, Marshall or Williams-like; (v) 41TG247, UI-71, Frio-like; (w) 41TG481, UI-36, morphologically Late Archaic; (x) 41TG489, UI-38, Frio-like; (y) 41TG489, UI-52, Langtry; (z) 41TG497, UI-48, morphologically Late Archaic; (aa) 41TG504, UI-306, Bulverde-like; (bb) 41TG512, UI-310, Langtry.*

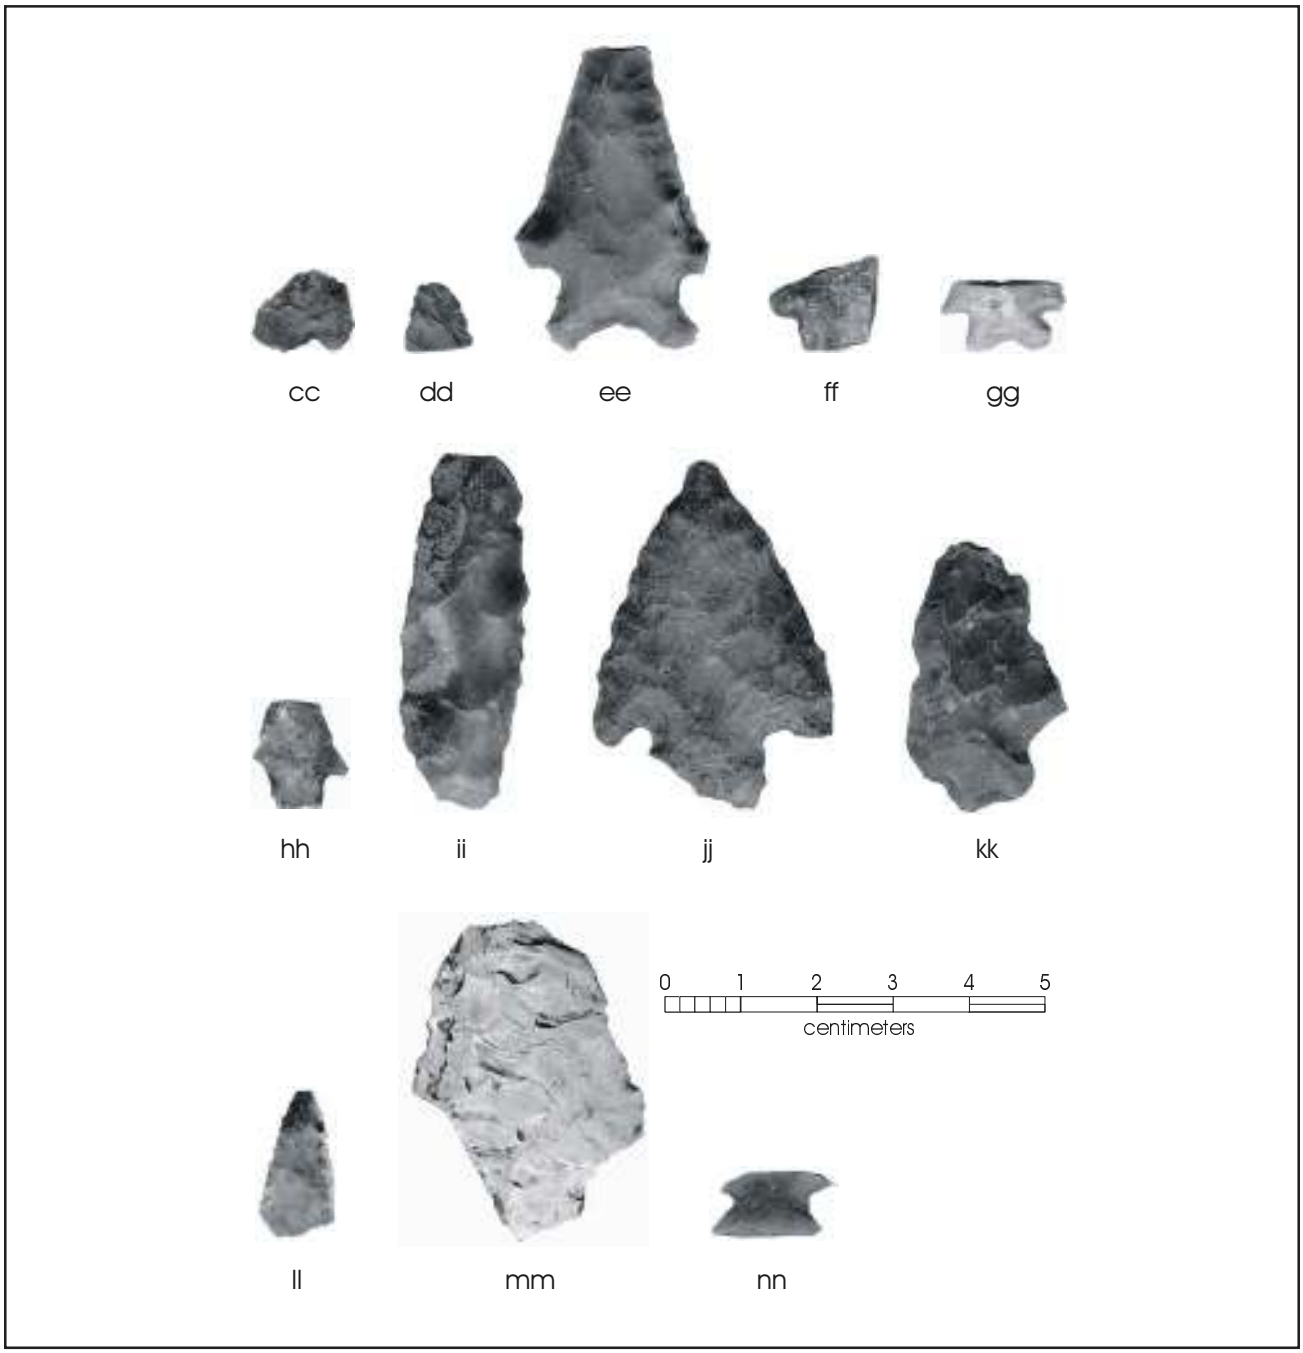

Figure F-6. *Late Archaic points (continued): (cc) 41TG517, UI-312, Marcos or Williams-like; (dd) 41TG518, UI-46, morphologically Late Archaic; (ee) 41TG252, UI-323, Frio; (ff) 41TG525, UI-316, morphologically Late Archaic, burinated; (gg) 41TG526, UI-317, Frio-like; (hh) 41TG534, UI-304, Marcos or Marshall-like; (ii) 41TG535, UI-61, Pedernales-like; (jj) isolated find, UI-19, Marshall or Williams-like; (kk) isolated find, UI-33, morphologically Late Archaic; (ll) isolated find, UI-314, Tortugas-like; (mm) isolated find, UI-324, morphologically Late Archaic; (nn) 41TG389, UI-69, Ensor or Ellis [possibly Late Prehistoric Scallorn].*

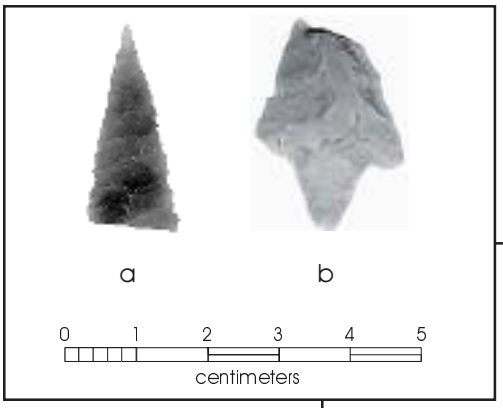

Figure F-7. *Late Prehistoric points: (a) 41TG424, UI-30, arrow point preform; (b) 41TG506, UI-301, Perdiz.*

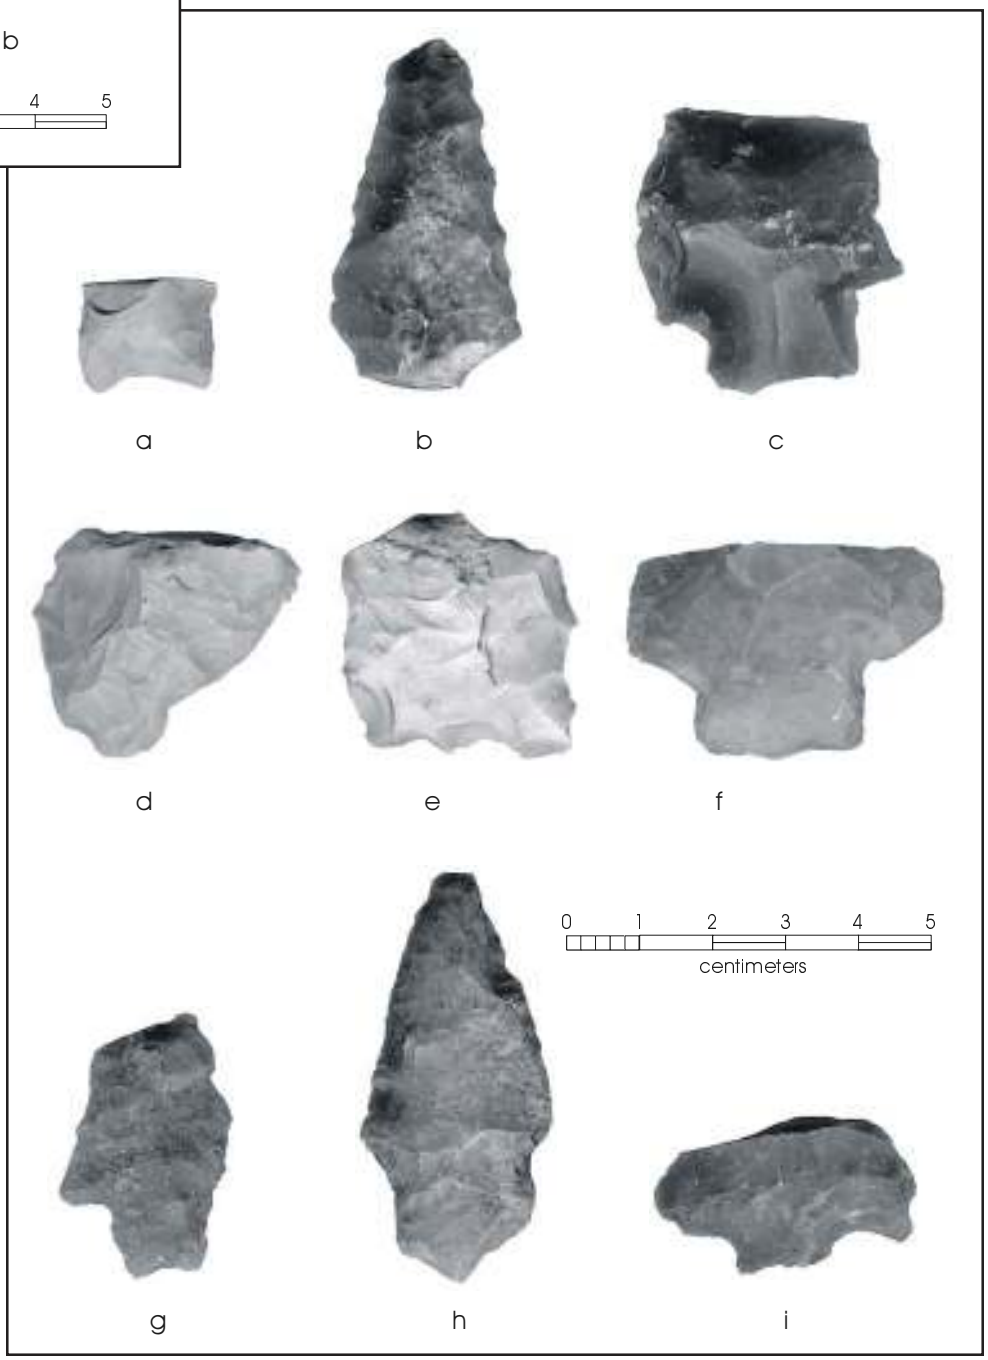

Figure F-8. *Untypeable points: (a) 41TG367, UI-4, point base; (b) 41TG253, UI-75, point fragment; (c) 41TG377, UI-11, dart point preform base; (d) isolated find, UI-311, point fragment; (e) 41TG534, UI-307, point base; (f) 41TG517, UI-313, dart point base; (g) 41TG389, UI-44, dart point fragment; (h) 41TG524, UI-73, dart point fragment (possible Pedernales); (i) 41TG531, UI-62, dart point fragment.*

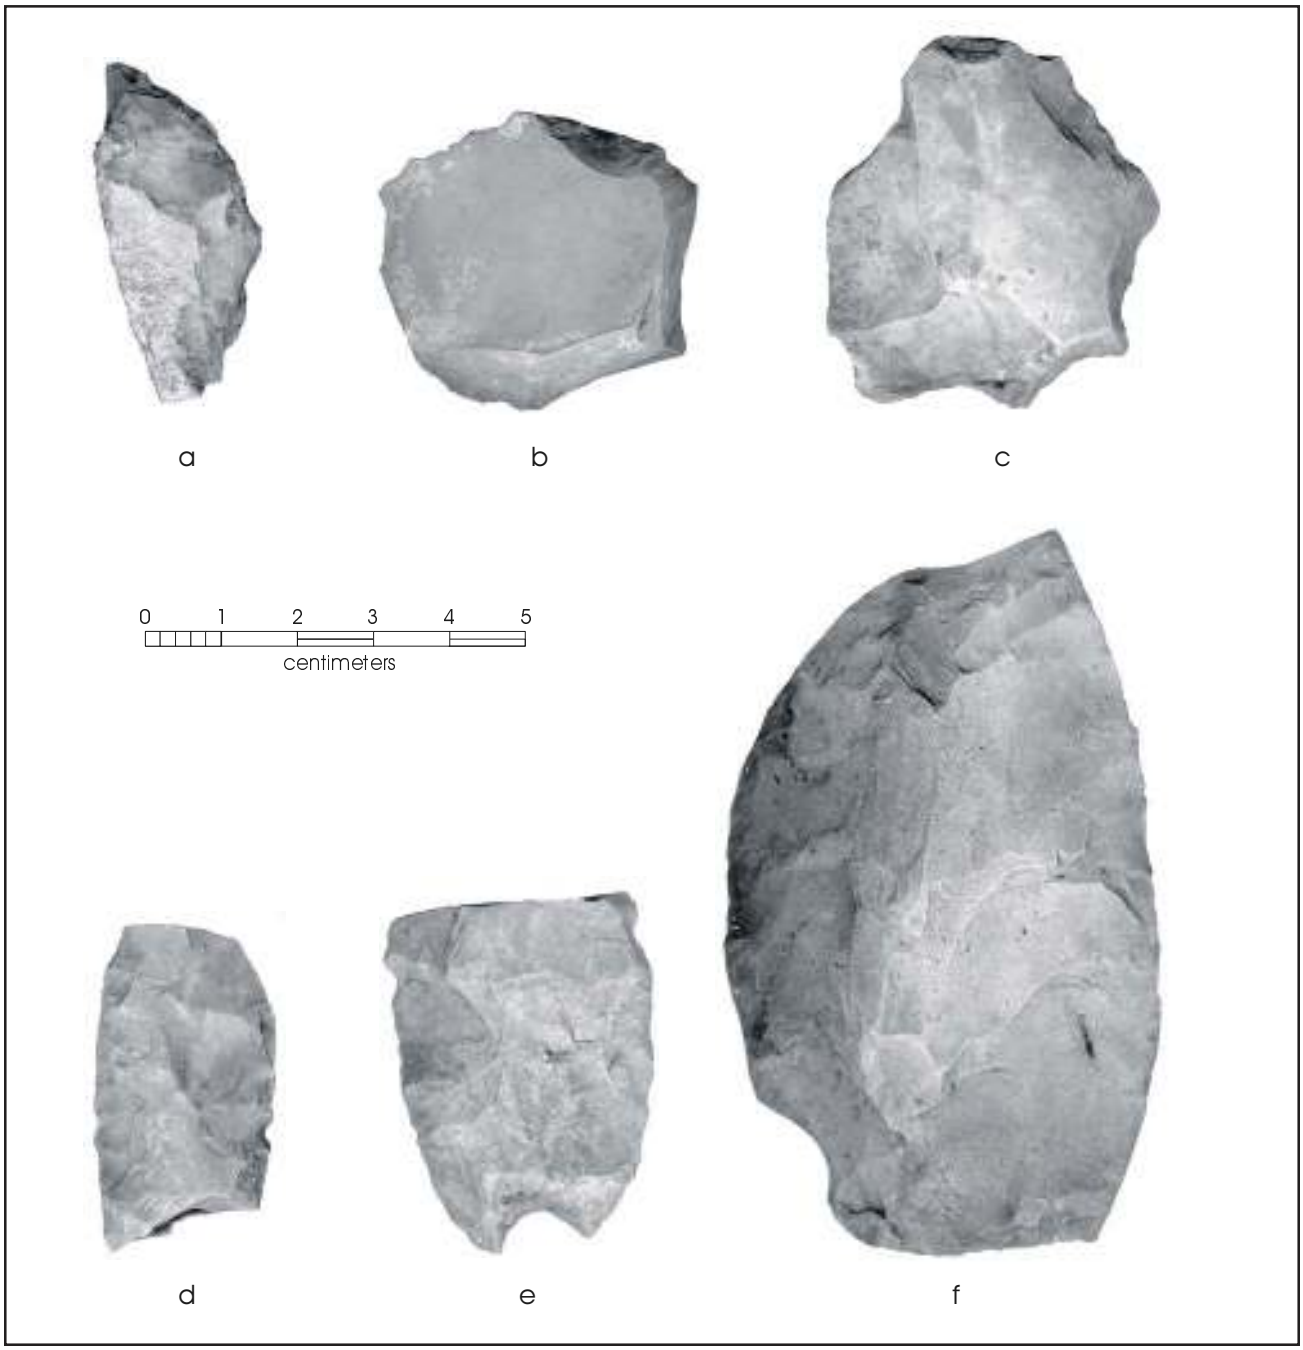

Figure F-9. *Bifaces: (a–e) 41TG378, UIs 13, 14, 17, 43, and 59, respectively; (f) 41TG429, UI-55.*

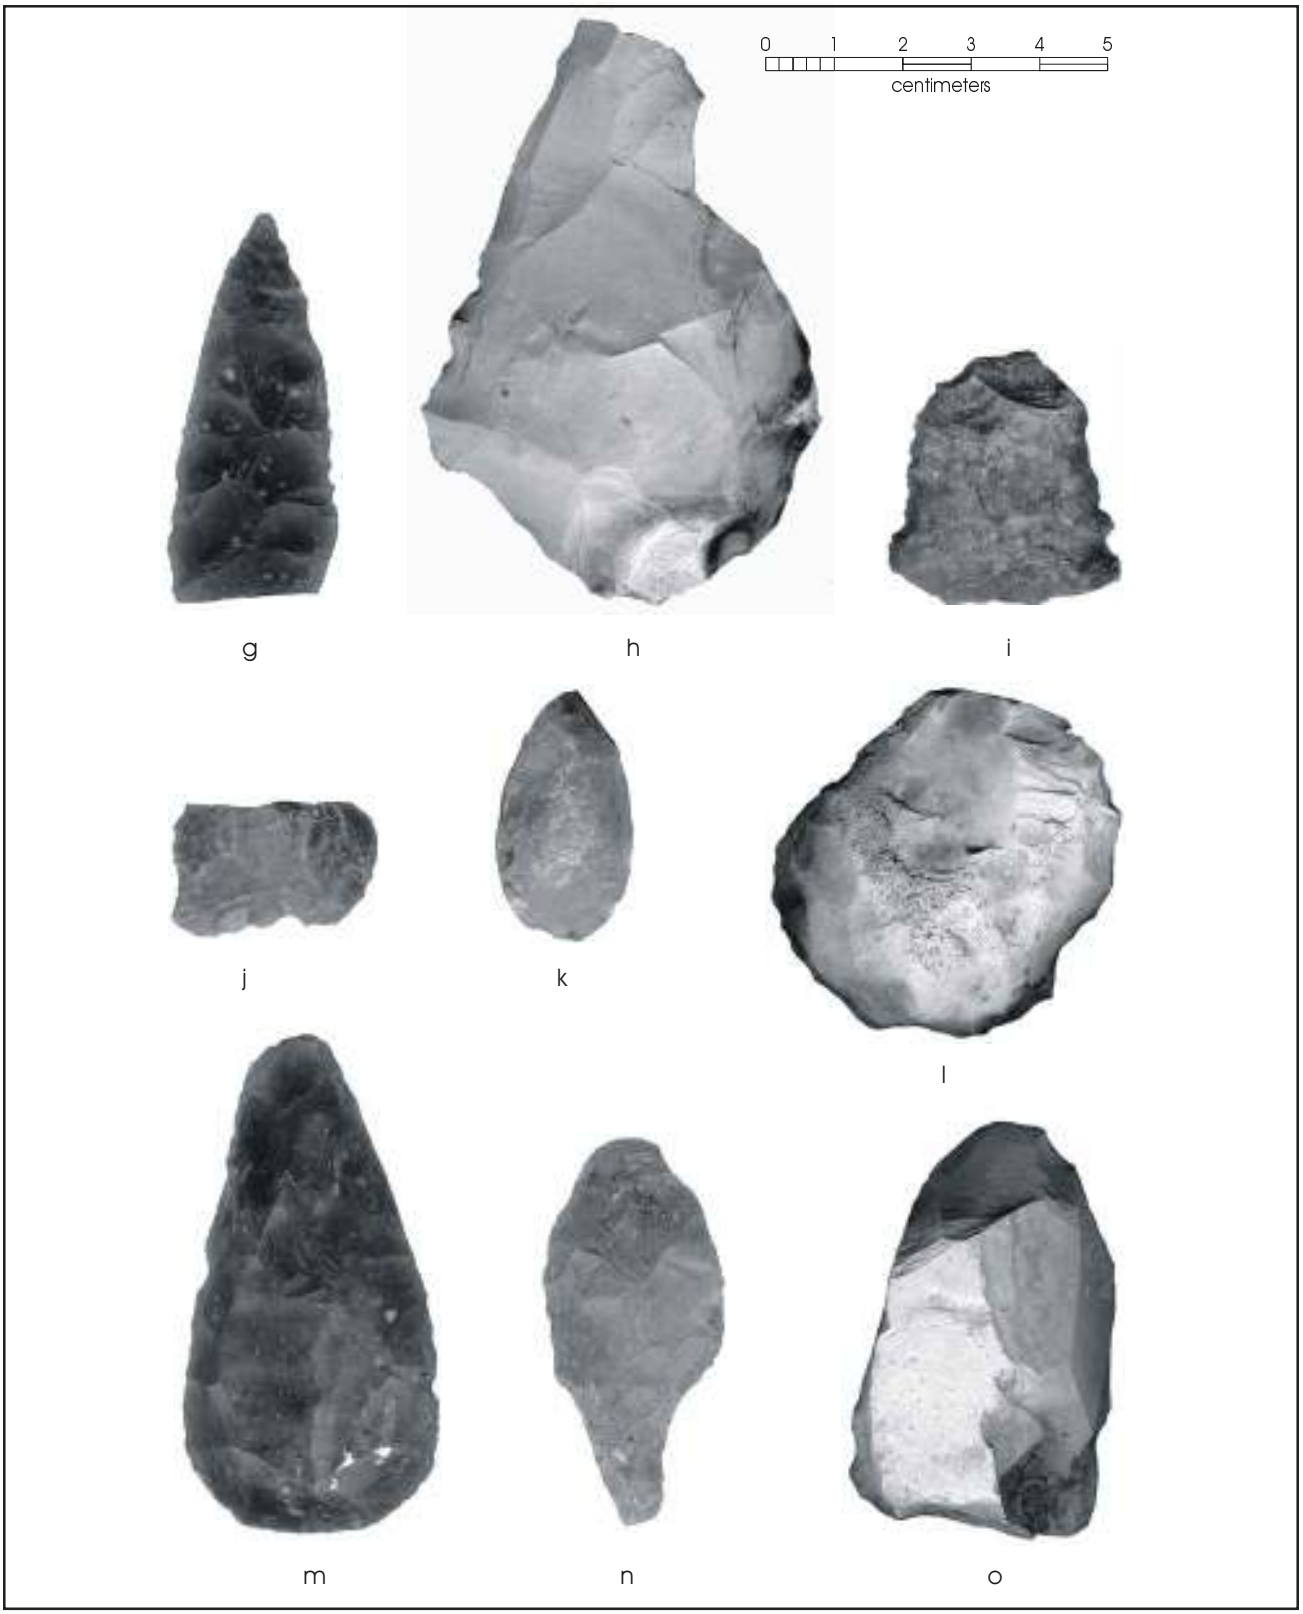

Figure F-10. *Bifaces (continued): (g) 41TG447, UI-74; (h) isolated find, UI-309; (i) 41TG485, UI-320; (j) 41TG486, UI-321; (k) 41TG378, UI-15, made from quartz; (l) 41TG420, UI-27, scraper; (m) 41TG252, UI-325, scraper; (n) 41TG382, UI-326, burin; (o) 41TG378, UI-16, core tool/gouge.*

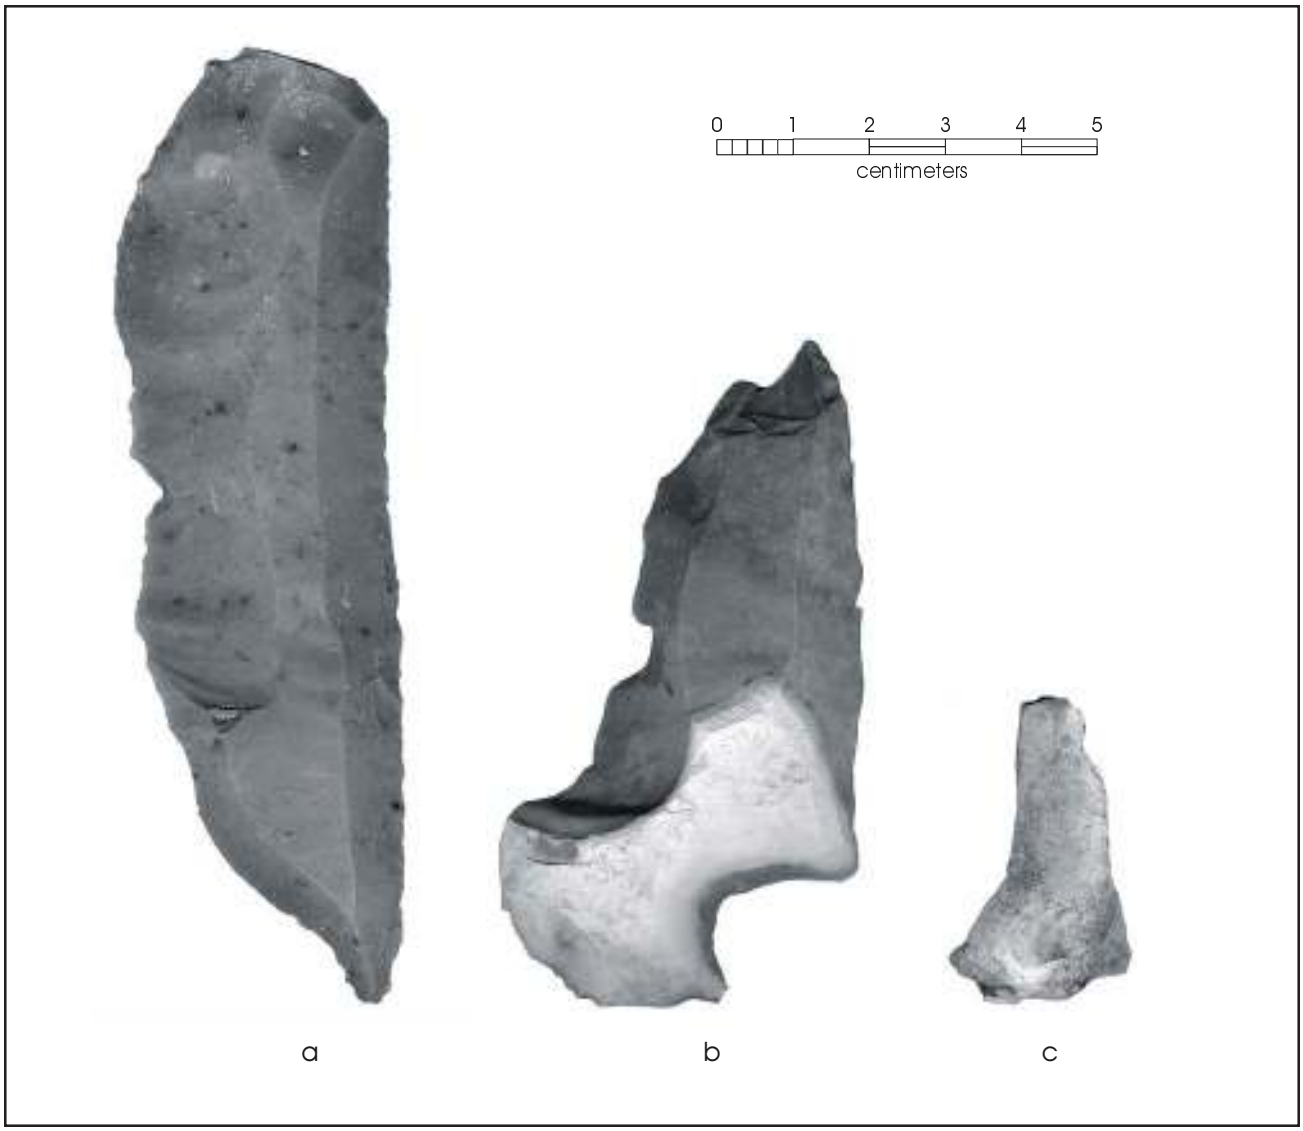

Figure F-11. *Unifaces: (a) 41TG513, UI-76, knife; (b) 41TG372, UI-9, flake tool; (c) 41TG378, UI-42, flake tool.*

Appendix G:
Twin Buttes Archaeological Project

Isolated Finds

This appendix provides individual summaries for all 393 isolated finds. The appendix consists of a table (Table G-1) with isolate information and a map (Figure G-1) showing the distribution of the isolated finds.

Table G-1 provides the UTM northing and easting for each isolate, maximum artifact length in cm, cortex percentage, and artifact type. The codes in the artifact type field are as follows: 1 = flake, 2 = core or tested cobble, 4 = biface, 5 = uniface, 6 = retouched/utilized item, 10 = projectile point. Note that projectile points were collected, so no attributes were recorded for the eight specimens in this table. Note that in a small number of cases, data are missing for a given attribute.

Figure G-1 is a map which provides distributional information.

Table G-1. Data for Isolated Finds

UTM Northing	UTM Easting	Length (cm)	Cortex (%)	Artifact Type
3460162	356860	.	.	10
3461440	356893	8.50	20.00	2
3461922	357078	11.50	60.00	2

REPORT OF RADIOCARBON DATING ANALYSES

Dr. Raymond Mauldin — Report Date: December 4, 1999

University of Texas at San Antonio — Material Received: November 4, 1999

Sample Data	Measured Radiocarbon Age	$^{13}C / ^{12}C$ Ratio	Conventional Radiocarbon Age (*)
Beta-136034	480 +/- 40 BP	-26.7 o/oo	460 +/- 40 BP
SAMPLE #: FS#52-9 ANALYSIS: Standard-AMS MATERIAL/PRETREATMENT:(charred material): acid/alkali/acid			
Beta-136035	870 +/- 40 BP	-25.4 o/oo	870 +/- 40 BP
SAMPLE #: FS#152-2 ANALYSIS: Standard-AMS MATERIAL/PRETREATMENT:(charred material): acid/alkali/acid			

NOTE: It is important to read the calendar calibration information and to use the calendar calibrated results (reported separately) when interpreting these results in AD/BC terms.

Dates are reported as RCYBP (radiocarbon years before present, "present" = 1950A.D.). By international convention, the modern reference standard was 95% of the C14 content of the National Bureau of Standards' Oxalic Acid & calculated using the Libby C14 half life (5568 years). Quoted errors represent 1 standard deviation statistics (68% probability) & are based on combined measurements of the sample, background, and modern reference standards.

Measured C13/C12 ratios were calculated relative to the PDB-1 international standard and the RCYBP ages were normalized to -25 per mil. If the ratio and age are accompanied by an (*), then the C13/C12 value was estimated, based on values typical of the material type. The quoted results are NOT calibrated to calendar years. Calibration to calendar years should be calculated using the Conventional C14 age.

CALIBRATION OF RADIOCARBON AGE TO CALENDAR YEARS

(Variables: C13/C12=-26.7:lab. mult=1)

Laboratory number: **Beta-136034**

Conventional radiocarbon age: **460±40 BP**

2 Sigma calibrated result: (95% probability) **Cal AD 1410 to 1480 (Cal BP 540 to 470)**

Intercept data

Intercept of radiocarbon age with calibration curve: Cal AD 1435 (Cal BP 515)

1 Sigma calibrated result: (68% probability) Cal AD 1425 to 1450 (Cal BP 525 to 500)

CALIBRATION OF RADIOCARBON AGE TO CALENDAR YEARS

(Variables: C13/C12=-18.4:lab. mult=1)

Laboratory number: **Beta-136280**

Conventional radiocarbon age: **3440±50 BP**

2 Sigma calibrated result: (95% probability) **Cal BC 1890 to 1625 (Cal BP 3840 to 3575)**

Intercept data

Intercept of radiocarbon age with calibration curve: Cal BC 1740 (Cal BP 3690)

1 Sigma calibrated result: (68% probability) Cal BC 1770 to 1685 (Cal BP 3720 to 3635)

REPORT OF RADIOCARBON DATING ANALYSES

Dr. Raymond Mauldin

University of Texas at San Antonio

Report Date: January 19, 2000

Material Received: Auth. Dec. 23, 1999

Sample Data	Measured Radiocarbon Age	$^{13}C / ^{12}C$ Ratio	Conventional Radiocarbon Age (*)
Beta-136275	7240 +/- 40 BP	-19.0 o/oo	7340 +/- 40 BP

SAMPLE #: BHT4Ab2
ANALYSIS: Standard-AMS
MATERIAL/PRETREATMENT:(organic sediment): acid washes

NOTE: It is important to read the calendar calibration information and to use the calendar calibrated results (reported separately) when interpreting these results in AD/BC terms.

Dates are reported as RCYBP (radiocarbon years before present, "present" = 1950A.D.). By international convention, the modern reference standard was 95% of the C14 content of the National Bureau of Standards' Oxalic Acid & calculated using the Libby C14 half life (5568 years). Quoted errors represent 1 standard deviation statistics (68% probability) & are based on combined measurements of the sample, background, and modern reference standards.

Measured C13/C12 ratios were calculated relative to the PDB-1 international standard and the RCYBP ages were normalized to -25 per mil. If the ratio and age are accompanied by an (*), then the C13/C12 value was estimated, based on values typical of the material type. The quoted results are NOT calibrated to calendar years. Calibration to calendar years should be calculated using the Conventional C14 age.

CALIBRATION OF RADIOCARBON AGE TO CALENDAR YEARS

(Variables: C13/C12=-19:lab. mult=1)

Laboratory number: **Beta-136275**

Conventional radiocarbon age: **7340±40 BP**

2 Sigma calibrated result: (95% probability) **Cal BC 6245 to 6080 (Cal BP 8195 to 8030)**

Intercept data

Intercept of radiocarbon age with calibration curve: Cal BC 6215 (Cal BP 8165)

1 Sigma calibrated result: (68% probability) Cal BC 6230 to 6185 (Cal BP 8180 to 8135)

Appendix I:
Twin Buttes Archaeological Project

Soil-Stratigraphic Descriptions

Middle Concho River

CB1a; Modern alluvium (MO) over Late Holocene alluvium (LH); Holocene flood terrace (6 m); calcareous throughout.

A/C1 0-18 cm; very dark grayish brown (10YR 3/2) silt loam; weak coarse subangular blocky; hard; common fine worm casts; clear smooth.

A/C1 18-43 cm; very dark grayish brown (10YR 3.5/2) silt loam; weak coarse subangular blocky; hard; few laminated clasts; common fine worm casts; clear smooth. Hearth charcoal radiocarbon age of 870±40 B.P. in lower part.

Ab 43-67 cm; very dark grayish brown (10YR 3/2) silt loam; moderate medium prismatic; hard; 1% carbonate filaments; common fine biocasts; gradual smooth.

Bw1b 67-100 cm; very dark grayish brown (10YR 3.5/2) silt loam; moderate coarse prismatic; hard; 1% carbonate filaments; few fine biocasts; hearth at upper contact; gradual smooth.

Bw2b 100-151 cm; brown (10YR 4/3) silt loam; weak coarse prismatic; hard; 1% carbonate filaments; few fine biocasts; gradual smooth.

Bw3b 221- 268 cm; brown (10YR 4/3) silt loam; weak coarse prismatic; hard; 1% carbonate filaments; few fine biocasts; gradual smooth.

Bw4b 268-322 cm; brown (10YR 4/3) silt loam; weak coarse prismatic; hard; few fine biocasts; dispersed charcoal sample; gradual smooth.

Bw5b 322-348 cm; brown (10YR 4/3, 5/3) silt loam; weak coarse prismatic; hard; few fine biocasts; clear smooth.

Bw6b 348-364 cm; brown (10YR 3.5/3) silt loam; weak coarse prismatic; slightly hard; few fine biocasts; gradual smooth.

Bw1b 364-418 cm; brown (10YR 3.5/3) silty clay loam; 10% brown (10YR 5/3); weak coarse prismatic; slightly hard; few fine biocasts; clear smooth.

Bw2b 418-452 cm; brown (10YR 3.5/3) silty clay loam; 10% brown (10YR 5/3); weak coarse prismatic; slightly hard; few fine biocasts; few fine clay clasts; clear smooth.

Bw3b 452- 483 cm; brown (10YR 4/3) silty clay loam; 20% brown (10YR 5/3); weak coarse prismatic; slightly hard; few fine biocasts; few fine clay clasts; gradual smooth.

Bkb 483-520 cm; brown (10YR 4/3) silty clay loam; 15% brown (10YR 5/3); weak coarse prismatic; very hard; 1% carbonate nodules, 0.5 to 1.5 cm, white, very hard; few fine biocasts; few fine clay clasts; gradual smooth.

BCkb 520-593 cm; brown (10YR 4/3, 5/3) and pale brown (10YR 6/3) silty clay loam; 15% brown (10YR 5/3); weak coarse prismatic; very hard; common faint laminations; 2% carbonate nodules, 0.5 to 1.5 cm, white, very hard; 1% carbonate filaments; few fine biocasts; few fine clay clasts; gradual smooth.

BCb 593-634 cm; bedded dark grayish brown (10YR 3.5/2) and brown (10YR 4/3) clay loam, and pale brown (10YR 6/3) silt loam, 2 to 10 cm thick; common faint laminations; massive; hard; 1% carbonate filaments.

CB1b; Modern alluvium (MO); modern floodplain (4 m); calcareous throughout.

A/C1 0-17 cm; dark brown (10YR 3/3) sandy clay loam; moderate fine subangular blocky; friable; common fine biocasts; common uncoated sand particles; gradual smooth.

A/C2 17-35 cm; very dark grayish brown (10YR 3/2) sandy clay loam; moderate medium subangular blocky; friable; common fine biocasts; common uncoated sand particles; gradual smooth.

Ab1 35-66 cm; very dark gray (10YR 3/1) loam; moderate medium subangular blocky; friable; gradual smooth.

Cb1 66-89 cm; very dark grayish brown (10YR 3/2) clay loam with 3 (0.5 cm) yellowish brown (10YR 5/4) beds; massive to weak coarse subangular blocky; slightly hard; clear smooth.

Ab2 89-119 cm; very dark gray (10YR 3/1) clay loam; 10% dark grayish brown (10YR 4/2); weak coarse subangular blocky; hard; gradual smooth.

C1b2 119-146 cm; dark grayish brown (10YR 4/2) sandy clay loam; 20% pale brown (10YR 6/3); massive; hard; faint bedding planes; gravel line in middle and bottom, 0.5 to 1 cm, subrounded, grain supported; abrupt smooth.

C2b2 146-212 cm; multiple beds 3 to 10 cm of very dark grayish brown (10YR 3/2) clay loam and pale brown loam (10YR 6/3) with 40% pebbles, 0.2 to 0.5 cm, subrounded; abrupt smooth. Bulk humate radiocarbon age of 910±60 B.P. in lower part.

C1b2 212-247 cm; 80% pebbles, 0.4 to 1 cm in upper half and 1 to 4 cm in lower half, moderately well sorted, subrounded, grain supported; abrupt smooth.

C2b2 247-394 cm; multiple light tan cross beds 10 to 50 cm thick, 50 to 80% pebbles, mostly subrounded, moderately sorted, 0.2 to 1 cm and 2 to 7 cm diameter.

Cb2 394-425 cm; dark brown (10YR 3/3); upper 10 cm massive clay loam with few fine pebbles, lower part 60% pebbles, 0.5 to 4 cm, mostly subrounded, moderately sorted, matrix supported.

CB2a; Latest Pleistocene alluvium (LP2); latest Pleistocene terrace (8-9 m); calcareous throughout; approximately upper 1 m truncated.

Bk 0-34 cm; brown (10YR 5.5/3) clay loam; moderate medium subangular blocky; hard; 5% carbonate nodules, 0.5 to 1.5 cm, white, slightly hard; 20% pebbles, 0.3 to 2 cm, subrounded, matrix supported, moderately sorted; gradual smooth.

BC 34-54 cm; brown (7.5YR 5/4) clay loam; 30% light brownish gray (10YR 6/2); moderate coarse angular blocky; hard; common disseminated carbonate; clear smooth.

BC 54-85 cm; brown (7.5YR 5.5/4) clay loam; moderate medium angular blocky; hard; 3% carbonate nodules, 0.5 cm, white, slightly hard; clear smooth.

Bkg 85-133 cm; light brownish gray (2.5Y 6/2) clay; moderate medium angular blocky; hard; 30% carbonate nodules, 0.5 to 2 cm, white, slightly hard to hard; gradual smooth.

BCg1 133-151 cm; light gray (2.5Y 7/2) clay loam; weak coarse angular blocky; firm; 1% pebbles, 1 cm, subrounded; clear smooth.

BCg2 151-191 cm; light gray (2.5Y 7.5/2) sandy clay loam; weak coarse angular blocky; firm; common medium distinct light olive brown (2.5Y 5/6) soft iron masses; clear smooth.

Cg 191-201 cm; light gray (2.5Y 7.5/2) clay loam; massive; very firm; 1% carbonate nodules, 0.2 to 0.5 cm, white, slightly hard; abrupt wavy. Bulk humate radiocarbon sample of 5760±70 B.P.

C1 201-301 cm; 70% pebbles, 1 to 8 cm, subrounded, grain supported, moderate sorted; tan loamy matrix with few iron stains; clear wavy.

C2 301-581 cm; 70% pebbles, multiple beds and cross beds, 1 to 8 cm and 0.2 to 0.5 cm, subrounded, grain supported, moderate sorted; occasional bedrock rip up clasts and cobbles up to 15 cm in lower half.

CB2b; Latest Pleistocene alluvium (LP2); latest Pleistocene terrace (8-9 m); calcareous throughout; approximately upper 1 m truncated.

BA 0-19 cm; brown (10YR 5/4) clay loam; moderate medium prismatic to moderate medium subangular blocky; very hard; 2% pebbles, 0.2 to 0.4 cm, subrounded to angular, matrix supported, moderately well sorted; gradual smooth.

Bk1 19 -39 cm; brown (10YR 5/4) clay loam; moderate medium prismatic to moderate medium angular blocky; very hard; 2% pebbles, 0.2 to 0.4 cm, subrounded to angular, matrix supported, moderately well sorted; 2% carbonate nodules, 1 cm, white, slightly hard to hard; gradual smooth.

Bk2 39-51 cm; brown (10YR 5/4) clay loam; moderate medium angular blocky; very hard; 5% carbonate nodules, 1 cm, white, slightly hard to hard; 3 % carbonate filaments; clear smooth.

B/Ck 51-70 cm; reddish brown (5YR 5/4) clay loam; common medium distinct yellowish brown (10YR 5/6) soft iron masses; faintly bedded; firm; 3% carbonate nodules, 1 cm, white, slightly hard to hard; 3% carbonate filaments; abrupt smooth.

Ck 70-98 cm; reddish brown (5YR 5/4) loam; common medium distinct yellowish brown (10YR 5/6) soft iron masses; massive; firm; 1% carbonate nodules, 0.5 cm, white, slightly hard to hard; 3% carbonate filaments; abrupt smooth.

C1 98-200 cm; 60% pebbles, 0.2 to 2 cm, subrounded, moderate sorted, grain supported and dipping; tan loamy matrix; abrupt wavy.

C2 200-500 cm; 70% pebbles, 1 to 15 cm, subrounded, moderate sorted, grain supported; tan loamy alluvium.

CB2c; Early Holocene alluvium (EH); Holocene flood terrace (6.0 m); calcareous throughout.

C 0-3 cm; very dark gray (10YR 3/1) loam; moderate medium platy; hard; abrupt wavy. (lake deposit)

A1 3-24 cm; very dark gray (10YR 3/2.5) clay loam; few fine distinct brown (7.5YR 4/4) iron pore linings; weak medium angular blocky; very hard; gradual smooth.

A2 24-53 cm; very dark grayish brown (10YR 3/2) clay loam; weak medium prismatic; very hard; gradual smooth.

Bw 53-91 cm; brown (10YR 3.5/3) clay loam; weak medium prismatic; very hard; gradual smooth.

Bk1 91-119 cm; brown (7.5YR 4/4) clay loam; weak medium prismatic to weak medium angular blocky; very hard; 1% carbonate filaments; 5% pebbles, 0.2 to 0.4 cm, subrounded, matrix supported, moderately well sorted; gradual smooth.

Bk2 119-185 cm; brown (7.5YR 4/4.5) clay loam; weak medium prismatic to weak medium angular blocky; very hard; 1% carbonate filaments; 1% pebbles, 0.5 to 1 cm, subrounded, matrix supported and 5% pebbles, 0.2 to 0.4 cm, subrounded, matrix supported, moderately well sorted; clear smooth.

Bk3 185-239 cm; brown (7.5YR 4/3) clay loam; weak coarse subangular blocky; firm; 2% carbonate filaments; 5% pebbles, 0.3 to 1 cm; subrounded, matrix supported, moderately well sorted; clear wavy.

C 239-275 cm; light brown (7.5YR 6/4) loam; 40% pebbles, 0.5 to 3 cm, subrounded, grain supported.

CB3 Early Holocene alluvium (EH); truncated Holocene flood terrace (6 m); calcareous throughout.

Bk1 0-80 cm; 70% pebbles, 0.2 to 0.6 cm and 1 to 6 cm, moderately sorted; grain supported, subrounded; 1 to 3 mm thick discontinuous carbonate pendants; brown (10YR 5/3) clay loam matrix; abrupt wavy.

Bk2 80-112 cm; brown (7.5YR 4/4) clay loam; 20% brown (7.5YR 5/3); weak coarse prismatic; very firm; 3% carbonate nodules, 0.5 to 1.5 cm, white, soft to hard; few biocasts.

Bw1 112-130 cm; brown (7.5YR 4/3) and light brown (7.5YR 6/3) clay loam; weak coarse prismatic; very firm; gradual smooth.

Bw2 130-160 cm; brown (7.5YR 4/3, 5/4) clay loam; weak coarse prismatic; firm; common fine distinct iron manganese root pores; gradual smooth.

BC 160-220 cm; pale brown (10YR 6/3) clay loam; 3% pebbles, 0.5 to 1 cm, subrounded, matrix supported; clear smooth.

C1 220-235 cm; light brown (7.5YR 6/4) clay loam; 15% pebbles, 1 to 3 cm, matrix supported, moderately sorted, subrounded; clear smooth.

C2 235-285 cm; 70% pebbles, 0.2 to 0.5 cm and 1 to 5 cm, moderately to poorly sorted; subrounded, grain supported; tan matrix; abrupt wavy.

C3 285-400 cm; very pale brown (10YR 7/3) sandy clay loam; few medium faint yellow iron soft masses; three pebbles beds, 10 cm thick, 1 to 3 cm, subrounded, grain supported, moderately well sorted; abrupt wavy.

C4 400-440 cm; 80% pebbles, 1 to 8 cm, grain supported, moderately sorted, subrounded; loamy gray matrix.

BHT-1; Modern alluvium (MO) over Early Holocene alluvium (EH); Holocene flood terrace (6.5 m); calcareous throughout.

A 0-9 cm; dark grayish brown (10YR 3.5/2) silt loam; 10% brown (10YR 4/3); moderate fine and medium platy; slightly hard; many biocasts; clear smooth.

Ab 9-51 cm; very dark grayish brown (10YR 3/2) silty clay loam; moderate medium and coarse angular blocky; hard; many biocasts; gradual smooth.

Bw1b 51-80 cm; dark yellowish brown (10YR 4/3.5) silty clay loam; moderate medium prismatic to moderate medium angular blocky; hard; common biocasts; gradual smooth.

Bw2b 80-112 cm; dark yellowish brown (10YR 4/4) silty clay loam; weak coarse prismatic; hard; common biocasts; few pebbles, subrounded, 1 cm; gradual smooth.

Bw3b 112-147 cm; dark yellowish brown (10YR 4/4) silty clay loam; weak coarse prismatic; very hard; few biocasts; few pebbles, subrounded, 1 cm; clear smooth.

Bkb 147-209 cm; dark yellowish brown (10YR 4/4) silty clay loam; weak coarse prismatic to weak coarse angular blocky; very hard; few biocasts; 2% carbonate filaments; gradual smooth.

BCb 209-279 cm; brown (10YR 4/3) and yellowish brown (10YR 5/4) silty clay loam; 5% yellowish brown (7.5YR 5/4) sandy patches; weak coarse prismatic; very hard; few biocasts; few pebbles, subrounded, 1 cm.

BHT-2; late Pleistocene alluvium (LP1); late Pleistocene terrace (12-14 m); calcareous throughout.

A 0-16 cm; very dark grayish brown (10YR 3/2) clay loam; moderate medium subangular blocky; hard; 3% pebbles, 0.5 to 1 cm, angular to subrounded, matrix supported, moderately sorted; gradual smooth.

BA 16-35 cm; yellowish brown (10YR 5/4) clay loam; 30% very dark grayish brown (10YR 3/2) biocasts; moderate medium to coarse angular blocky; hard; 4% carbonate clasts, 0.5 to 1 cm, white, slightly hard; 3% pebbles, 0.2 to 0.4 mm, angular to subrounded, moderate sorted, matrix supported; gradual smooth.

Bw 35-53 cm; brown (7.5YR 5/4) clay loam; few fine faint strong brown (7.5YR 4/6) soft iron masses; 2% very dark grayish brown (10YR 3/2) biocasts; moderate coarse angular blocky; very hard; 1% carbonate clasts, 0.5 to 1 cm, white, slightly hard; 1% pebbles, 0.2 to 0.4 cm, angular to subrounded, moderate sorted, matrix supported; clear smooth.

Bk1b 53-74 cm; brown (7.5YR 5/4) clay; moderate medium angular blocky; very hard; 15% carbonate nodules, 0.5 to 1.5 cm, white, slightly hard to hard; clear smooth.

Bk2b 74-144 cm; yellowish brown (5YR 5/4) clay; moderate medium prismatic to moderate medium angular blocky; very hard; 20% carbonate nodules, 0.5 to 1.5 cm, white, slightly hard to hard; gradual smooth.

BCkb 144-173 cm; brown (7.5YR 5/4) clay; weak coarse prismatic; very hard; 25% yellowish brown (5YR 5/4) pockets; 5% disseminated carbonate soft masses; clear smooth.

Bk1b 173-203 cm; brown (7.5YR 5.5/4) clay; weak coarse prismatic; very hard; 10% carbonate nodules, 0.5 to 1.5 cm, white, slightly hard to hard; gradual smooth. Bulk humate radiocarbon sample of 9260±70 B.P.

Bk2b 203-234 cm; light brown (7.5YR 6/4) clay; weak coarse prismatic; very hard; 15% carbonate nodules, 0.5 to 1.5 cm, white, slightly hard to hard; few fine organic root pores; gradual smooth.

Bk3b 234-326 cm; light brown (7.5YR 6/4) clay; weak coarse prismatic; very hard; 40% carbonate nodules, 0.5 to 1.5 cm, white, slightly hard to hard; clear smooth.

Cb 326-345 cm; brown (7.5YR 5/4) clay; 10 % light brown (7.5YR 6/3) pockets; massive; very hard; 2% carbonate clasts, 0. 5 cm, white, hard.

BHT-3; Early Holocene alluvium (EH); Holocene flood terrace (6.5 m); calcareous throughout.

A1 2-6 cm; very dark gray (10YR 3/1) clay loam; moderate medium subangular blocky; hard; common fine distinct strong brown (7.5YR 5/6) pore linings; gradual smooth.

A2 6-28 cm; very dark grayish brown (10YR 3.5/2) clay loam; moderate medium subangular blocky; friable; gradual smooth.

Bw 28-70 cm; brown (10YR 5.5/3) clay loam; moderate medium subangular blocky; firm; few very dark gray (10YR 3/1) biocasts; clear smooth.

Bk1 70-91 cm; yellowish brown (10YR 5/4) clay loam; few fine faint yellowish brown (10YR 5/8) pore linings; moderate medium angular blocky; hard; 2% carbonate filaments; gradual smooth.

Bk2 91-118 cm; brown (10YR 5.5/4) clay loam; moderate medium angular blocky; hard; 3% carbonate nodules, 0.5 to 1 cm, white, slightly hard to hard; 3% pebbles, 1 to 2 cm, subrounded, moderately sorted, matrix supported; gradual smooth.

Bk3 118-161 cm; dark grayish brown (10YR 4/2) and brownish yellow (10YR 6/6) clay loam; moderate medium angular blocky; hard; 10% pebbles, 1 to 3 cm, subrounded, moderately sorted, matrix supported; 2% carbonate nodules, white, slightly hard to hard; clear wavy.

Bk4 161-198 cm; light brownish gray (10YR 6/2) clay loam; weak coarse angular blocky; very hard; 10% dispersed carbonate masses, 0.3 to 0.5 cm; abrupt wavy.

Bkmb 198-210 cm; many cemented waterworn pebbles and cobbles, 2 to 10 cm, subrounded, moderately sorted.

BHT-4; Late Holocene (LH) over Early Holocene alluvium (EH); Holocene flood terrace (6.5 m); calcareous throughout.

A 0-14 cm; very dark gray (10YR 3.5/1) silty clay loam; moderate fine and medium subangular blocky; friable; 10% strong brown (7.5YR 4/6) iron pore linings; gradual smooth.

BA 14-30 cm; dark gray (10YR 4/1) silty clay loam; common fine distinct strong brown (7.5YR 4/6) iron pore linings; moderate medium subangular blocky; friable; gradual smooth.

Bw1 30-63 cm; brown (10YR 4/2.5) clay loam; common fine distinct strong brown (7.5YR 4/6) iron pore linings; moderate medium angular blocky; hard; gradual smooth.

Bw2 63-117 cm; grayish brown (10YR 4.5/2) clay loam; moderate medium angular blocky; hard; few fine faint dark yellowish brown (10YR 4/6) soft iron masses; 1% carbonate filaments; clear smooth.

Bw1b 117-150 cm; dark grayish brown (3.5/2) clay; 30% brown (10YR 5/3); moderate coarse prismatic; very hard; gradual smooth.

Bw2b 150-184 cm; brown (7.5YR 5/3) clay; moderate coarse prismatic; very hard; gradual smooth.

Bkb 184-218 cm; brown (7.5YR 5/3) and light brown (7.5YR 6/3) clay; moderate coarse prismatic; very hard; 1% carbonate nodules, 0.5 to 1 cm, white, hard; gradual smooth.

BC1b 218-272 cm; brown (7.5YR 5/4, 4/2) clay; moderate coarse prismatic; very hard; clear smooth.

BC2b 272-321 cm; brown (7.5YR 4.5/4, 4/2) clay; moderate coarse prismatic; very hard; 1% carbonate nodules, 0.5 cm, white, hard; 1% pebbles, subrounded, 1 cm, matrix supported; clear smooth. Bulk humate radiocarbon age of 7340±40.

Cgb 321-364 cm; light gray (10YR 7/2) and light yellowish brown (7.5YR 6/4) loam; common medium distinct light bluish gray (5B 7/1) iron depletions; massive; very firm; 1% pebbles subrounded, 1 cm, matrix supported; partially carbonate cemented in lower part.

41TG378 (TU1); Holocene colluvium (HO) over Permian bedrock; upland deflational hillslope; calcareous throughout.

Bw1 0-15 cm; brown (7.5YR 5/4) sandy clay loam; moderate mediums subangular blocky; friable; few fine distinct brown (7.5YR 4/4) iron pore coats; 2% carbonate clasts 0.2 to 0.4 cm, white, hard, angular; many fine roots; clear smooth.

Bw2 15-29 cm; brown (7.5YR 5/4) sandy clay loam; moderate medium subangular blocky; friable; few fine distinct brown (7.5YR 4/4) iron pore coats; 15% carbonate clasts 0.3 to 1 cm, white, hard, angular; few large rip up carbonate clasts, 0.5 to 3 cm, angular, white, very hard; common fine roots; clear smooth.

Bw3 29-38 cm; brown (7.5YR 5/4) clay loam; 30% light reddish brown (2.5YR 6/4); moderate medium subangular blocky; firm; few fine roots; abrupt wavy.

C/Bb 38-54 cm; faint bedding planes, pale yellow (5Y 8/2), 30% brown (7.5YR 5/4), 5% light reddish brown (2.5YR 6/4) silt loam; massive to weak coarse subangular blocky; hard; few fine roots; abrupt smooth.

Crb 54-95 cm; multiple bedding planes, 1 to 5 cm, pale yellow (5Y 8/2), 30% brown (7.5YR 5/4), 5% light reddish brown (2.5YR 6/4), olive yellow (2.5Y 6/6), greenish gray (10GY 6/1) silt loam; few thin nodular iron zones.

41TG389 (TU1); Holocene eolian undifferentiated (HO); upland hillslope; calcareous throughout.

A 0-12 cm; brown (10YR 4/3) fine sandy loam; few fine distinct brown (7.5YR 4/4/) iron pore linings; moderate medium subangular blocky; friable; many fine roots; gradual smooth.

Bw 12-29 cm; brown (10YR 4/3) fine sandy loam; few fine distinct brown (7.5YR 4/4) iron pore linings; moderate medium subangular blocky; friable; many fine roots; 2% carbonate clasts, angular, 0.2 to 0.3 cm; clear smooth.

Bw 29-59 cm; brown (10YR 4/3) sandy clay loam; 15% brown (10YR 5/3); common fine distinct brown (7.5YR 4/4) iron pore linings; moderate medium and coarse subangular blocky; firm; many fine roots; abrupt wavy.

Bkmb 59-63 cm; carbonate cemented channel gravels.

41TG410 (TU1); late Holocene alluvium (LH); Holocene flood terrace (6.5 m); calcareous throughout.

A1 0-11 cm; very dark grayish brown (10YR 3/2) silt loam; moderate fine and medium subangular blocky; firm; many roots and worm casts; gradual smooth.

A2 11-26 cm; dark grayish brown (10YR 4/2) silt loam; moderate medium subangular blocky; firm; many fine and medium roots and worm casts; gradual smooth.

Bw1 26-45 cm; dark grayish brown (10YR 4/2) silt loam; moderate medium angular blocky; firm; many fine and medium roots and worm casts; gradual smooth.

Bw2 45-66 cm; brown (10YR 5/3) loam; moderate coarse angular blocky; hard; common fine and medium roots and worm casts; 1% carbonate filaments; gradual smooth.

Bw3 66-95 cm; brown (10YR 5/3) loam; weak coarse prismatic; hard; few fine and medium roots and worm casts; 1% carbonate filaments.

South Concho River

CB6; Early Holocene alluvium (EH); Holocene flood terrace (6.5 m); calcareous throughout. Quarry pit with 1.5 m of overburden.

A 0-35 cm; very dark grayish brown (10YR 3/2) silty clay loam; moderate medium subangular blocky; very hard; gradual smooth.

AB 35-72 cm; brown (10YR 4.5/3) silty clay loam; moderate coarse subangular blocky; firm; gradual smooth.

Bk 72-142 cm; brown (10YR 4/3) silty clay loam; 15% brown (7.5YR 5/4); moderate medium angular blocky; firm; 1% carbonate filaments; 5% pebbles, 0.5 to 1.5 cm, subrounded, matrix supported, moderately sorted; 6 cm pebble line at base of horizon; abrupt smooth.

BC1 142-178 cm; light brown (7.5YR 6/4) silty clay loam; weak coarse subangular blocky; firm; 3% pebbles, 0.5 to 1.5 cm, subrounded, matrix supported, moderately sorted; gradual smooth.

BC2 178-269 cm; strong brown (7.5YR 5/6) silty clay loam; 20% light yellowish brown (10YR 6/4); weak coarse subangular blocky; firm; gradual smooth.

BC3 269-336 cm; light yellowish brown (10YR 6.5/4) sandy clay loam; massive; friable; abrupt wavy.

C 336-466 cm; 65% pebbles, 0.5 to 5 cm, subrounded, grain supported, moderately sorted.

CB7; Modern alluvium (MO) over Late Holocene alluvium (LH) over Early Holocene alluvium (EH); Holocene flood terrace (6.0 m); calcareous throughout. Quarry pit exposure.

A 0-13 cm; very dark grayish brown (10YR 3/2) silty clay loam; moderate medium subangular blocky; hard; clear smooth.

Ab1 13-49 cm; black (10YR 2/1) silty clay loam; moderate medium subangular blocky; hard; abrupt wavy.

Bwb1 49-111 cm; very dark gray (10YR 2.5/1) loam; 50% pebbles, 1-8 cm, subrounded, matrix and grain supported, moderately sorted; abrupt wavy.

Cb1 111-158 cm; dark grayish brown (10YR 4/2) loam; 50% pebbles, 1-8 cm, subrounded, matrix and grain supported, moderately sorted; abrupt wavy.

Bkb1 158-203 cm; brown (3.5/3) clay loam; moderate medium prismatic; very hard; 1% carbonate filaments; abrupt wavy. Bulk humate radiocarbon age of 3440±50 B.P.

Cb1 203-277 cm; 70% bedded pebbles, 1 to 6 cm, subrounded, matrix and grain supported, moderately sorted; brown (10YR 4/3) loamy; abrupt wavy.

Bkb2 277-300 cm; brown (7.5YR 5/3) clay loam; few medium distinct strong brown (7.5YR 5/6) soft iron masses; 10% carbonate filaments.

Spring Creek

CB5; Late Holocene alluvium (LH); Holocene flood terrace (4.5 m); calcareous throughout.

A 0-18 cm; very dark gray (10YR 3.5/1) clay loam; moderate medium and coarse subangular blocky; hard; common uncoated sand grains; abrupt smooth.

C1 18-31 cm; very dark gray (10YR 3/1) clay loam; 50% bedded pebbles, 0.3 to 0.6 cm and 1 to 4 cm, poorly sorted, subrounded, grain supported; abrupt smooth.

C2 31-49 cm; very dark gray (10YR 3/1) clay loam; moderate medium subangular blocky; hard; occasional discontinuous pebble beds, 0.3 to 0.6 cm and 1 to 4 cm, poorly sorted, subrounded, grain supported; abrupt wavy.

C3 49-134 cm; very dark gray (10YR 3.5/1) clay loam; 60% pebbles, matrix and grain supported, 1 to 2 cm and 3 to 10 cm, subrounded, moderately to moderately well sorted; abrupt wavy.

ABkb 134-153 cm; dark grayish brown (10YR 4/2.5) clay; moderate medium prismatic; very hard; 2% carbonate filaments; gradual smooth.

Bk/Cb 153-228 cm; brown (7.5YR 4/3) clay; 2% carbonate filaments; 10 cm pebble bed in middle, 60%, 1-5 cm, subrounded, moderately well sorted, grain supported; abrupt wavy.

C1b 228-276 cm; brown (7.5YR 4/3) clay loam; multiple beds of pebbles, 0.2 to 0.4 cm and 0.5 to 1.5 cm, subrounded, moderately to poorly sorted, grain supported; abrupt wavy.

C2b 276-301 cm; 65% pebbles, 1 to 7 cm, moderately sorted, subrounded, grain supported; loamy brown matrix; abrupt wavy.

C3b 301-330 cm dark grayish brown (10YR 4/3.5) clay; massive; very firm.

C4b 330-380 cm; 65% pebbles, 1 to 6 cm, subrounded, grain supported, moderately sorted; brown loamy matrix; abrupt wavy.

C5b 380-400 cm; brown (10YR 4/3) clay loam; 2% carbonate filaments; massive; firm. Bulk humate radiocarbon age of 3460±60 B.P.

BHT-8; Late Pleistocene alluvium (LP1), late Pleistocene terrace; calcareous throughout.

A 0-17 cm; very dark grayish brown (10YR 3/2) clay loam; moderate medium subangular blocky; firm; common fine distinct brown (7.5YR 4/4) iron pore linings; gradual smooth.

Bw 17-37 cm; brown (7.5YR 5/4) silty clay loam; few fine faint brown (7.5YR 4/4) iron pore linings; weak medium subangular blocky; friable; abrupt irregular.

Bk1 37-83 cm; light brown (7.5YR 6/4) silty clay loam; common fine distinct yellowish brown (10YR 5/6) soft iron masses; 50% coalescing soft to hard carbonate masses; moderate medium angular blocky; hard; abrupt wavy.

Bk2 83-150 cm; brown (7.5YR 5/4) clay; few biocasts; moderate coarse angular blocky; hard; 20% carbonate nodules, 1 to 2 cm, slightly hard to hard, white; gradual smooth.

BCk3 150-197 cm; light brown (7.5YR 6/4) silty clay loam; moderate coarse prismatic; very hard; 1% carbonate clasts, 1 cm, subrounded; common organic/manganese root linings.

BHT-9; truncated version of BHT-8.

BHT-10; Early Holocene alluvium (EH); Holocene flood terrace (6.5 m); calcareous throughout.

Bk 0-49 cm; brown (7.5YR 5/4) clay loam; common fine distinct dark yellowish brown (10YR 4/6) iron pore linings; moderate to strong medium angular blocky; very hard; 3% carbonate filaments; gradual smooth.

Bw1 49-120 cm; light reddish brown (5YR 6/4) clay loam; weak coarse prismatic; very firm; gradual smooth.

Bw2 120-210 cm; pink (7.5YR 7/4) loam; common medium distinct light gray (5Y 7/1) iron depletions; weak coarse prismatic; very firm; gradual smooth.

Bw3 210-265 cm; pink (7.5YR 7/4) loam; 20% brown (7.5YR 5/4); common medium distinct light gray (5Y 7/1) iron depletions; weak coarse prismatic; very firm; gradual smooth.

Unnamed/No Name Tributary

CB4; Late Holocene alluvium (LH) over early Holocene alluvium (EH) over Permian bedrock; Holocene flood terrace (3 m); calcareous throughout.

A 0-30 cm brown (7.5YR 5/4) clay loam; moderate medium subangular blocky; firm; few fine distinct strong brown (7.5YR 5/6) iron pore linings; clear smooth. (lake deposit)

A1 30-46 cm; very dark grayish brown (10YR 3/2) clay loam; few fine distinct dark yellowish brown (10YR 4/6) iron pore linings; strong fine and medium angular blocky; very firm; gradual smooth.

A2 46-71 cm; dark grayish brown (10YR 4/2) clay loam; few fine distinct yellowish brown (10YR 5/8) iron pore linings; moderate medium angular blocky; very firm; gradual smooth.

Bk 71-107 cm; brown (10YR 5/3) clay loam; moderate medium and coarse angular blocky; very firm; few fine distinct yellowish brown (10YR 5/8) iron pore linings; 2% carbonate nodules, white, hard, 0.5 to 1.5 cm; clear smooth.

Abkb1 107-142 cm; brown (7.5YR 4/3) clay loam; many distinct clay/organic ped coats; moderate medium angular blocky; very firm; 5% carbonate nodules, white, hard, 0.5 to 1.5 cm; gradual smooth.

Bkb1 142-169 cm; brown (7.5YR 4/4) clay loam; common distinct clay/organic ped coats; moderate medium angular blocky; very firm; 12% carbonate nodules, 0.5 to 2 cm, white, hard; clear smooth.

Bw1b1 169-215 cm; strong brown (7.5YR 5/8) clay loam; weak medium subangular blocky; firm; clear smooth.

Bw2b1 215-248 cm; strong brown (7.5YR 5/6) sandy clay loam; weak coarse angular blocky; firm; gradual smooth.

B/Cb1 248-297 cm; multiple beds 2 to 10 cm of pink (7.5YR 8/4) and strong brown (7.5YR 5/6) fine sandy loam; weak coarse subangular blocky; friable; gradual smooth.

Cb1 297-325 cm; 70% pebbles, 0.2 to 0.5 cm, well sorted, subrounded, grain supported.

Crb2 325 cm; yellow and olive sandstone bedrock.

BHT-5; Late Holocene alluvium (LH); Holocene flood terrace (3 m); calcareous throughout.

A 0-12 cm; very dark gray (10YR 3.5/1) clay loam; moderate fine and medium subangular blocky; friable; 5% dark yellowish brown (10YR 4/4) iron pore linings; gradual smooth.

BA 12-28 cm; dark grayish brown (10YR 4/2) clay loam; moderate medium subangular blocky; friable; 8% dark yellowish brown (10YR 4/4) iron pore linings; many very dark gray (10YR 3/1) biocasts; gradual smooth.

Bw1 28-70 cm; brown (7.5YR 4.5/4) clay loam; 5% dark yellowish brown (10YR 4/6) iron pore linings; common very dark gray (10YR 3/1) biocasts; moderate medium and coarse subangular blocky; firm; gradual smooth.

Bw2 70-101 cm; brown (7.5YR 5/4) clay loam; common very dark gray (10YR 3/1) biocasts; moderate medium angular blocky; firm; gradual smooth.

Bw3 101-153 cm; strong brown (7.5YR 5.5/6) clay loam; few very dark gray (10YR 3/1) biocasts; few fine dark gray (10YR 4/1) pore iron depletions; moderate medium and coarse angular blocky; very firm; clear smooth.

By 153-230 cm; brown (7.5YR 5/4) clay loam; few fine dark gray (10YR 4/1) pore iron depletions; moderate medium and coarse angular blocky; very firm; 5% gypsum crystals 0.2 to 0.3 cm.

Estimated description from extended trench.

230-310 cm; 60% pebbles, 1 to 8 cm, subrounded, moderately to poorly sorted, matrix supported; yellowish brown (10YR 5/4) clay loam matrix.

310-340 cm; brownish yellow (10YR 6/6) very fine sandy loam; 3% dark yellowish brown (10YR 4/4) iron pore linings; 2% light gray (10YR 7/1) iron depletions.

BHT-6; Late Holocene alluvium (LH) over early Holocene alluvium (EH); Holocene flood terrace (3 m); calcareous throughout.

C 0-8 cm; light gray (2.5Y 7/1) fine sandy loam; single grained; few fine faint yellowish brown (10YR 5/6) iron pore linings; abrupt wavy. (lake deposit).

A1 8-33 cm; very dark gray (10YR 2.5/1) clay loam; moderate medium subangular blocky; friable; few fine faint dark yellowish brown (10YR 3/4) iron pore linings; gradual smooth.

A2 33-51 cm; very dark gray (10YR 2.5/1) clay loam; moderate medium subangular blocky; friable; common fine distinct yellowish brown (10YR 5/6) iron pore linings; gradual smooth.

Bw1 51-76 cm; very dark grayish brown (10YR 3.5/2) clay loam; moderate medium angular blocky; hard; 15% dark yellowish brown (10YR 3/4) iron pore linings; 2% carbonate filaments; 5% pebbles, 0.2 to 0.4 cm, subrounded, moderately sorted; gradual smooth.

Bw2 76-103 cm; yellowish brown (10YR 4.5/4) clay loam; 5% strong brown (7.5YR 5/6) pore linings; moderate medium angular blocky; 10% pebbles, 0.2 to 0. 8 cm, subrounded, moderately sorted, matrix supported; 2% carbonate filaments; abrupt wavy.

ABb 103-118 cm; brown (7.5YR 4/3) clay; 5% very dark gray (10YR 3/1) biocasts; moderate coarse angular blocky; very hard; 1% carbonate filaments; common distinct clay/organic ped coats; gradual wavy. Bulk humate radiocarbon age of 3360±50 B.P.

Bkb 118-150 cm; brown (7.5YR 4/4) clay; few very dark gray (10YR 3/1) biocasts; moderate medium and coarse prismatic; very hard; 5% carbonate nodules, 1 cm, white, hard; common distinct clay/organic ped coats; gradual wavy.

Bwb 150-199 cm; brown (7.5YR 4/3) clay; few very dark gray (10YR 3/1) biocasts; common medium distinct dark gray (10YR 4/1) iron depletions; moderate coarse prismatic; very hard; common distinct clay/organic ped coats; clear wavy.

Byb 199-221 cm; brown (7.5YR 4/3, 10YR 5/3) clay; 2% gray (10YR 5/1) iron depletions; moderate medium prismatic to moderate medium angular blocky; firm; 10% gypsum crystals, 0.2 to 0.4 cm; abrupt wavy.

Cb 221-241 cm; brownish yellow (10YR 6/6) sandy clay; 20% light yellowish brown (10YR 6/4); few gray (2.5Y 6/1) iron depletions; massive; very firm; few fine carbonate nodules.

BHT-7; Late Pleistocene alluvium (LP1); Late Pleistocene terrace (5 m); calcareous throughout. Deflated surface by 20 to 30 cm.

C 0-10 cm light gray (2.5Y 7/2) fine sand; single grained; few fine faint brown (7.5YR 4/4) iron pore linings; abrupt wavy. (lake deposit)

A 10-22 cm; yellowish brown (10YR 5/4) sandy clay loam; weak medium to coarse subangular blocky; friable; 1% carbonate nodules, 0.5 to 1 cm, white, hard; clear wavy.

ABk 22-41 cm; reddish yellow (7.5YR 6/6) sandy clay loam; 20% brown (7.5YR 5/4); weak coarse subangular blocky; friable; 10% carbonate nodules, 0.5 to 1 cm, white, hard; gradual wavy.

Bk1 41-70 cm; reddish yellow (7.5YR 6/6) sandy clay loam; 5% strong brown (7.5YR 5/6) iron soft masses; weak coarse subangular blocky; friable; 8% carbonate nodules, 0.5 to 1 cm, white, hard; gradual wavy.

Bk2 70-112 cm; strong brown (7.5YR 5.5/6) fine sandy loam; 5% strong brown (7.5YR 5/6) iron soft masses; weak coarse angular blocky; firm; 15% carbonate nodules, 0.5 to 1.5 cm, white, hard; gradual wavy.

Bk3 112-151 cm; reddish yellow (7.5YR 6.5/6) fine sandy loam; 40% light brown (7.5YR 6/3); weak coarse prismatic; hard; 10% carbonate nodules, 0.5 to 1.5 cm, white, hard; gradual wavy.

BC 151-174 cm; yellowish red (5YR 5/6) and pale brown (7.5YR 6/3) fine sandy loam; weak coarse prismatic; hard; 1% carbonate nodules, 0.5 cm, white, hard; abrupt wavy.

C 174-200 cm; gravely and sandy bedded with common laminations; gravel beds-60% pebbles, 0.2 to 0.5 cm, subrounded, moderately well sorted, grain supported; sandy beds-light brown (7.5YR 6.5/4). Permian bedrock at base.

Paleomagnetic and Magnetic Soil Susceptibility Results

by Wulf Gose

Introduction

This appendix presents the results of soil susceptibility sampling from 41TG378, 41TG389, and 41TG410, and the results of archaeomagnetic samples collected from a fire-cracked rock feature at 41TG389. A brief background of these analyses is given, followed by specific site analyses. The reader is referred to Chapter 6 for a discussion of the methods used to process the samples.

Soil Susceptibility Analysis

Background

The magnetic susceptibility (MS) is a parameter which is proportional to the magnetic mineral content of a rock or soil sample. If the sample contains only one magnetic mineral, then the susceptibility is a direct measure of the concentration of this mineral. The susceptibility of a natural soil can be modified by pedogenic as well as cultural processes. Both processes tend to enhance the MS. In the organic-rich top layer of a soil, the susceptibility increases by as much as a factor of ten, probably due to the creation of maghemite as a result of organic activities (e.g., Singer and Fine 1989). If the soil is subsequently buried, this increase is preserved and can be used to identify paleosols.

The susceptibility is also enhanced by the action of fire. In the reducing environment of a wood-burning fireplace, new magnetic minerals are formed such as magnetite or maghemite. This effect can be observed in rocks and soils, as well as in the ash from the wood (Gose 2000; McClean and Kean 1993; Tite and Mullins 1971). The heat and ash produced by a grass fire are insufficient to enhance the MS.

Site Analysis

41TG378

Samples for magnetic susceptibility measurements were collected in 3-cm intervals down to 100 cm below datum. The susceptibilities are very low, close to the detection limit of the instrument. The profile shows two distinct zones; from the surface to a depth of about 48 cm and from 62 cm to 100 cm (Figure J-1). The intervening interval is a transition zone. No obvious expressions of human activity can be discerned. The two susceptibility units correspond well with the observed lithology which shows Permian strata overlain by Holocene beds (see Chapter 4).

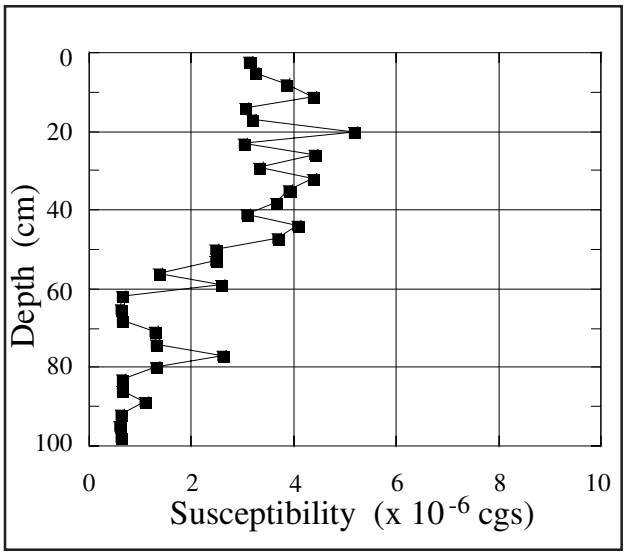

Figure J-1. *Soil susceptibility profile of Unit 1, 41TG378.*

41TG389

Profiles 31E and 31W are very similar (Figures J-2 and J-3). Both show a decrease in susceptibility up-section. The two top samples in profile 31W have much lower susceptibilities than the other samples and the sample at the 7.5-cm depth in profile 31E is very large. These three samples seem to be "contaminated" or, in some way, not representative of these sections. The general upward decrease in susceptibility suggests an influx of material from a different source area. At the level where a burned rock feature was found, both profiles show one sample with larger susceptibility values (at 25 cm in profile 31E and at 40 cm in profile 31W). Such increases can be due to the presence of wood ash (e.g., Collins et al. 1994).

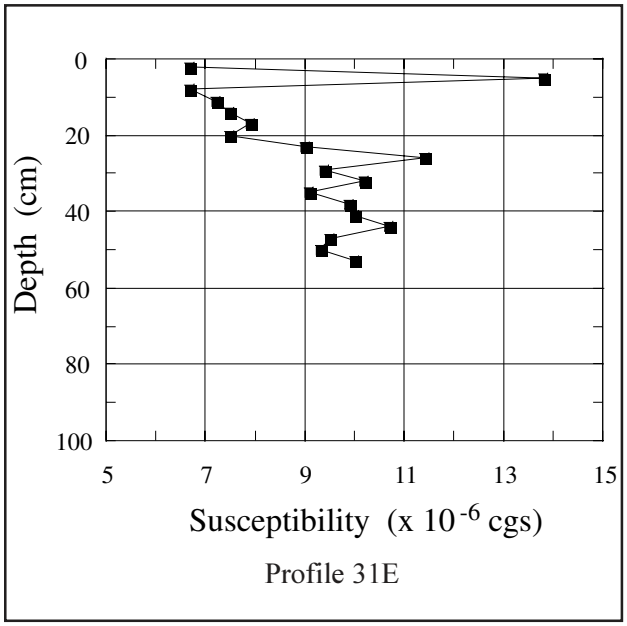

Figure J-*2. Soil susceptibility profile of the east wall of Unit 1, 41TG389.*

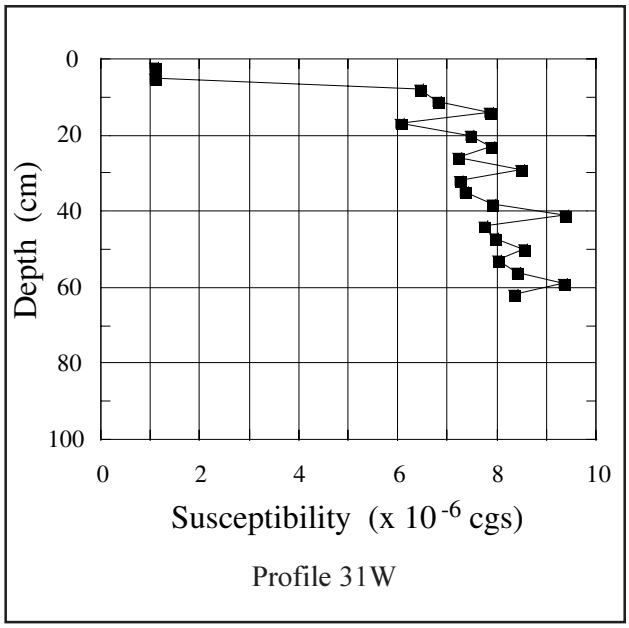

Figure J-3. *Soil susceptibility profile of the west wall of Unit 1, 41TG389.*

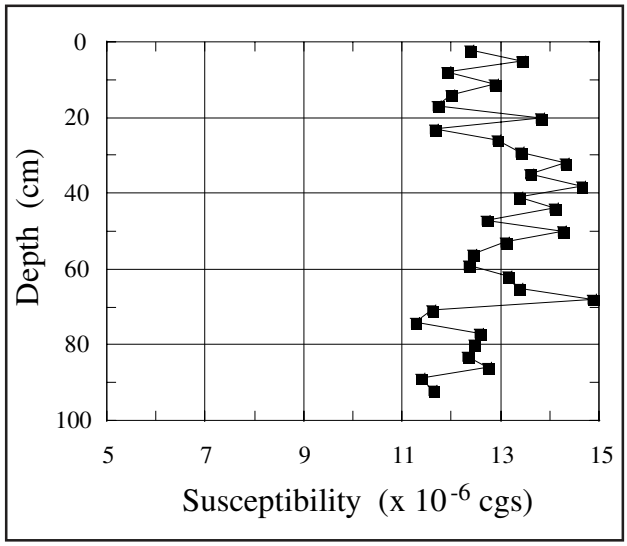
41TG410

Samples from this one meter long profile (Figure J-4) yielded the largest susceptibility values of the four sites, averaging about 13 x 10^{-6} cgs (centimeter, gram, second) units. The variations with depth are small. In the interval from 30 to 50 cm or possibly 70 cm below datum the values are slightly larger. This may be the result of human activity, mainly the burning of wood.

Figure J-4. *Soil susceptibility profile of Unit 1, 41TG410.*



Archaeomagnetic Analysis of Heated Rocks - 41TG389

Background

Paleomagnetic methods can be applied to a variety of archaeological problems. The most common application of archaeomagnetism makes use of the secular variation of the earth's magnetic field for dating archaeological sites (e.g., Eighmy and Sternberg 1990). The material used in these studies typically is taken from clay-lined fire pits. As the fireplace cools to ambient temperature, the magnetic minerals in the clay liner will acquire a thermoremanent magnetization (TRM). The direction of this TRM will be parallel to the geomagnetic field as seen at this site and at this point in time. Similarly, if a stone is heated above the Curie temperature of its magnetic mineral(s), it will be magnetized parallel to the ambient magnetic field if it cools *in situ*. The Curie temperature is a mineral specific temperature above which all magnetic alignments are randomized and thus all prior magnetic information is lost. The value for magnetite is 580°C and 680°C for hematite. If, on the other hand, the stone is moved while cooling it will acquire partial thermoremanent magnetization (pTRM) components for each temperature interval during which the stone was not moved. If moved only once at temperature T1, say 300°C, then the rock will have two components of magnetization, one corresponding to the time when the rock cooled from above its Curie temperature to 300°C and a second component which was acquired between 300°C and the ambient temperature. In the laboratory, these components can often be identified by detailed progressive demagnetization.

The paleomagnetic data are best viewed in a vector component diagram. Here, the magnetic vector is projected onto two perpendicular planes, typically the north-south-east-west plane and the up-down-horizontal plane, and the two graphs are combined into one figure. Each demagnetization step yields one point in each plane and the sequential data points are connected. A component of magnetization is identified by at least three colinear points. The data are analyzed in three dimensions by the principal component analysis (PCA, Butler 1992; Kirschvink 1980). PCA calculates the best-fitting vector over a selected demagnetization range.

The resulting directions of magnetization are then plotted in a stereographic projection. The declination is counted clockwise starting at north and the inclination varies from 0º at the periphery to 90º at the center of the stereonet. The paleomagnetic methods as applied to archaeological samples has recently been reviewed by Gose (2000).

Site Analysis

Eleven burned rock samples from a fire-cracked rock feature at 41TG389 were subjected to paleomagnetic analyses. All samples were thermally demagnetized in 50ºC increments from 150ºC to 550ºC. All samples contained two components of magnetization as best seen in vector component diagrams for rocks J, E, and H (Figure J-5). In these diagrams, the normalized intensity of magnetization is plotted for all demagnetization

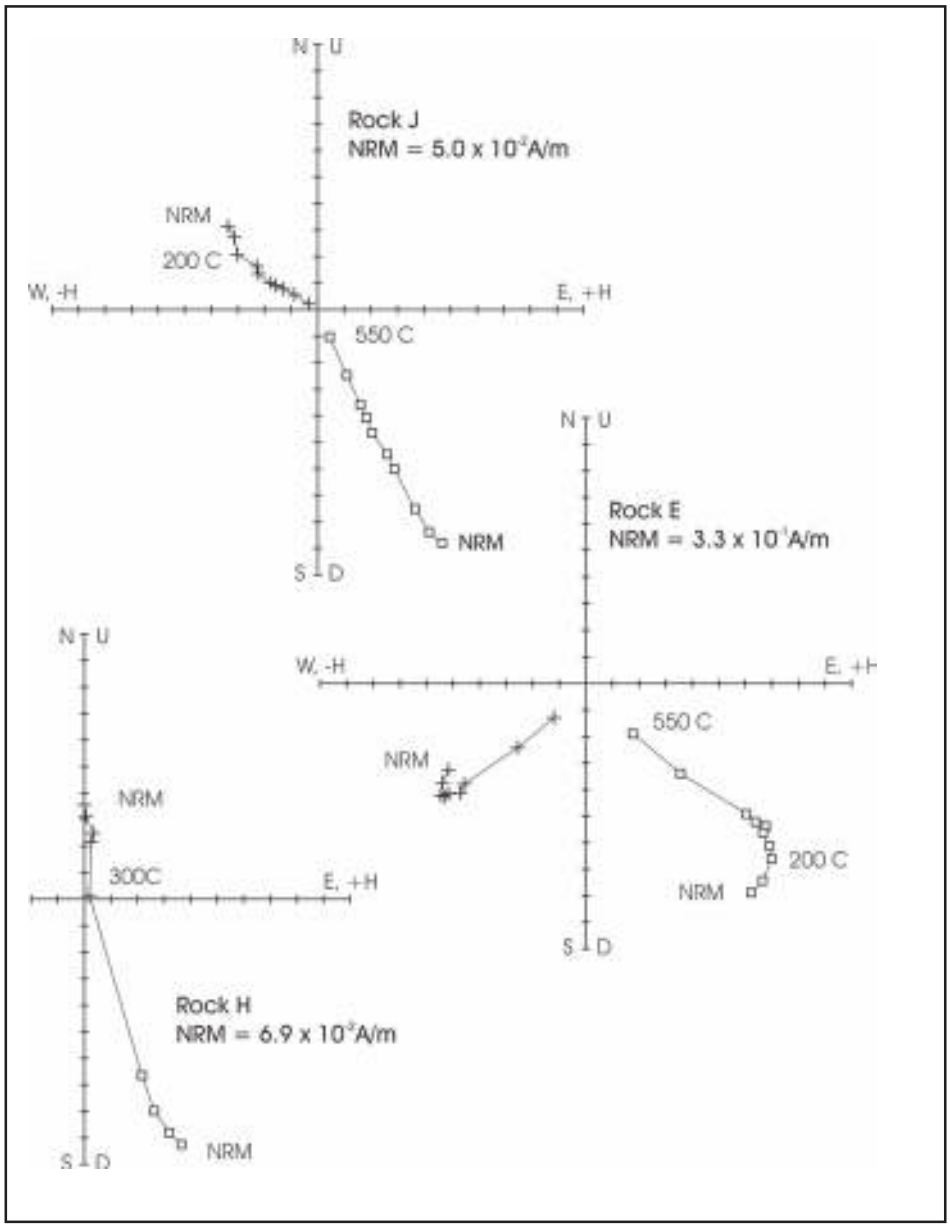


Figure J-5. *Components of magnetization in vector component diagrams for rocks J, E, and H.*

steps in two perpendicular planes. A component of magnetization is identified by three or more colinear points and the best fitting vector is calculated by the principal component method (Kirschvink 1980). All samples contain a low-temperature component which is stable up to 200 or 250ºC and a high temperature component which, in most cases, is stable up to 550ºC.

The directions of the best fitting vectors are plotted in a stereographic projection in Figure J-6. An examination of Figure J-6a indicates that all of the rocks contain a low temperature magnetization at 250ºC which clusters near the present dipole field direction, except for rock I.

Sample I has a negative direction of magnetization implying that this rock was turned upside down after it cooled. When heated beyond 250ºC, the directions of the high temperature components scatter, representing the original, geological magnetization. These results imply that the rocks were heated to about 250ºC and cooled, and have remained *in situ* since. Only rock I was turned over.

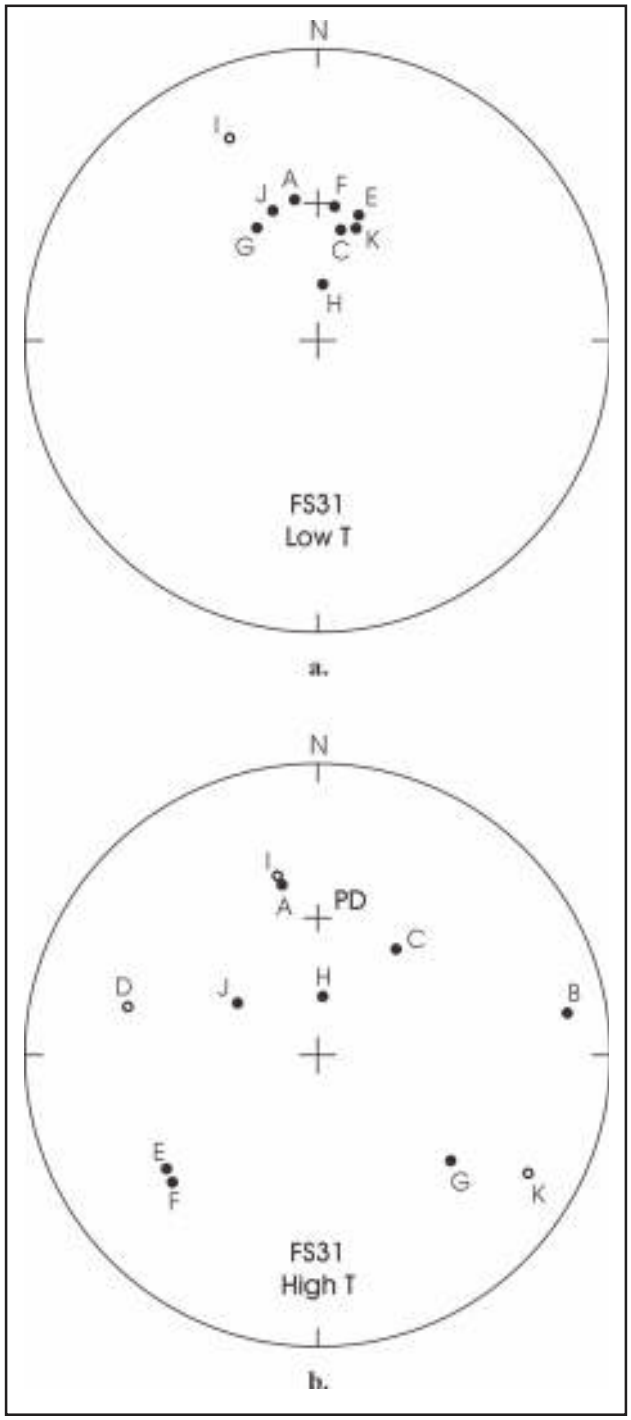

Figure J-6. *Directions of the best fitting vectors in a stereographic projection for (a) low temperature, ca. 250^{0}C, and (b) high temperature, >250^{0}C, representing the original, geological magnetization.*

Project Forms

This appendix provides copies of all forms used on the Twin Buttes survey, along with information sheets.

1) Twin Buttes survey site checklist. Two pages.
2) Twin Buttes shovel test form, and explanation sheet. Two pages.
3) Isolated find log. One page.
4) Unique item log. One page.
5) Photographic log. One page.
6) Archaeomagnetic sample log. One page.
7) Unit level excavation form. Two pages.
8) Collection bag log. One page.
9) Surface observation area recording form and explanation. Three pages.

TWIN BUTTES SURVEY
SITE CHECKLIST - Phase I

Field Site #_____ Area_____ Nearest Station and Transect_____

1. Identify surface artifact distribution, establish boundary, and then place site datum with "iron rebar and aluminum identification tag.

2. Complete sketch map.
   Indicate provenience of datum, features, and diagnostics collected. Map in artifact concentrations, disturbed areas, slope, approximate boundary, and natural terrain features such as drainages, etc.

3. Take GPS readings on site datum and boundary.

4. Complete the following checklist:

Artifacts	Present	Absent
Cores		
Primary Flakes		
Secondary Flakes		
Tertiary Flakes		
Tested Cobbles		
Quarry Blanks		
Preforms		
Bifaces		
Unifaces		
Retouched Flakes		
Utilized Flakes		
Ground Stone		
Fire Cracked Rock (Not Modern)		
Prehistoric Hearth		

Prehistoric Ceramics		
Historic Ceramics or Glass		
Historic Metal		
Historic Structure		

5. Make subjective and general observations about the site:

a. Setting (circle one) riverine, terrace, upland

b. Vegetation_____

c. Estimated surface visibility (%)_____

d. Nearest extant water_____

e. Observable landmarks (and Degrees)_____

f. Subjective evaluation of disturbance which equates to % of site still intact_____

g. Estimated debitage present (check mark on line):

<10____>10____ >50____ >100____ >150____>300____ >500____ >1,000____

h. Estimated fire cracked rock present (check mark on line):

Twin Buttes shovel test form.

1. **Depth** – top and bottom layer, centimeters from surface.

2. **Color** – Munsell Chart, moist or dry, but indicate which–be consistent!

1. **Texture** –
   Type = 1. Sand 2. Sandy Loam 3. Loam 4. Silt Loam 5. Clay Loam 6. Clay
   Consistency (moist) = Loose Friable Firm Extremely Firm

4. **Structure** –
   Type: 1. Massive 2. Blocky 3. Prismatic 4. Granular 5. Platy
   Size = fine < 2cm medium < 5cm coarse > 5cm
   Grade = weak moderate strong

5. **Mottles** – Color = Munsell Chart
   Abundance = few <2% common <20% many >20%
   Size = fine <0.5cm medium <1.5cm coarse >1.5cm
   Contrast = faint distinct prominent

6. **Inclusions** – manganese, charcoal, calcium carbonate, pebbles-cobbles, roots, rodent burrows, leaf litter, artifacts, features, or anything else.

7. **Lower Boundary** –
   Distinctness = very abrupt <1mm abrupt <2.5cm clear <6cm
   gradual <12.5cm diffuse >12.5cm
   Topography = smooth, wavy, irregular, broken, sloping, horizontal

8. **Soil Horizon** – O, A, B, E, C, R – if you are sure!

Field Definitions of Texture –

1. Sand – loose and single grained—moist squeezed cast will crumble

2. Sandy Loam – mostly sand with silt and clay—individual sand grains visible, moist cast can bear careful handling

3. Loam – even mixture of sand, silt, and clay—gritty, but smooth and slightly plastic, moist cast handled freely

4. Silt Loam – fine sands, little clay, mostly silt—dry clods break easily, soft, smooth and floury if dry, moist casts don't break, won't ribbon

5. Clay Loam – dry clods are hard, moist ribbon breaks easily, moist cast bears heavy handling, kneaded heavy compact mass that won't crumble

6. Clay – very hard clods, very plastic ad sticky if wet, flexible ribbon

Twin Buttes Surface Observation Area recording form, page 1.

SURFACE OBSERVATION DATA COLLECTION INFORMATION

Recording Unit: Refers to the recording unit- area (e.g., A1; A2,....An) or Dog Leash (DL1, DL2...).

Artifact Type: Codes 1 through 7.

1. Flakes. All utilized flakes and/or debris which cannot be classified as a core, tool, or ground stone. Flakes and debris do not necessarily have to have a clearly distinguishable ventral and dorsal surface - pieces often referred to as "chunks" or "angular debris" are of this type.

2. Cores. Cores are defined as any parent block from which flakes have been removed. This category does not, however, include tools. Cores must have at least three negative bulbs and cannot have a positive bulb; if a positive bulb is present in this classification, it is a flake and not a core. "Flake cores" were not a category for the purposes of this analysis.

3. Tested Cobbles. A tested cobble must have had one or two negative bulbs present; no positive bulb.

4. Bifaces. This type includes any item on which both facies have flake scars that cover at least 1/3 of the face and have been removed in a systematic manner. This class includes points, preforms, and blanks. Pieces elsewhere called "bifacial cores" were considered as cores for the purposes of this analysis, and functional use was not considered.

5. Unifaces. This type includes any item on which only one face has systematically removed flakes that cover at least 1/3 of that face. In some cases, unifacial retouch may be accompanied by use and retouch; in this case the piece was still classified as a uniface.

6. Retouched/Utilized Flakes. This type includes any item on which flakes have been systematically removed from an edge, but which does no qualify as a biface or uniface.

7. Other. This includes any specimen not covered above such as ground stone, hammer stone, etc. Their identity would be specified in the comments section.

Maximum Length:
This is the maximum length of an artifact, recorded in 1-cm units (0 to 1 = 1; 1 to 2 cm = 2; 2 to 3 cm = 3....etc.).

Maximum Thickness:
This is the maximum thickness of an artifact, recorded in 1-cm units as shown above for Maximum Length.

Cortex:
This is the percentage of cortex on the dorsal surface (including the platform) of all items with the exception of cores, tested cobbles, and the "other" artifact type (see notes below). The following groupings were used:

0%	= No Cortex	Code as 0
1-25%	= Cortex	Code as 12
26-50%	= Cortex	Code as 38
51-75%	= Cortex	Code as 62
76-99%	= Cortex	Code as 88
100%	= Cortex	Code as 100

On Cores, tested cobbles, and "other" types the following codes were used:

No Cortex	Code as 0
Less than 51% Cortex	Code as 25
More than 50% Cortex	Code as 75

Material Type/Color:
The vast majority of the material was coded as "1", which is either grey, brown, or blue-grey. Codes 2 and 4 are white and/or pale white. Code 3 is either pinkish or red; often heat-treated. Code 9 is any other color.

Comments:
Any additional information or observations not covered by the above.

Appendix L:
Twin Buttes Archaeological Project

Previous Land Ownership

by Tanya Norris, Katie Plum, Preston Stone, and David Nickels

This appendix provides a brief synthesis of land ownership prior to 1962 for properties on which historic sites were identified during the Twin Buttes survey. This information was compiled from deed records and maps from the West Texas Collection at Porter Henderson Library, Angelo State University, and the Tom Green County Courthouse Annex, San Angelo, Texas. In addition to land ownership and oil and gas maps, the most current USGS Quadrangle maps (*Twin Buttes, Pecan Station,* and *Knickerbocker*) were used to locate more modern structures. In many cases the maps used did not provide complete information, and therefore they are not referenced in the tables.

Map 1 cited in the tables is a Twin Buttes Reservoir Land Acquisition map drawn by the United States Department of the Interior, Bureau of Reclamation, September 27, 1962 (copy on file, CAR-UTSA).

Copies of maps obtained from the West Texas Collection and cited in the tables are:

2	1945 Ownership Map, Tom Green County.
TW-8	1959 Oil and Gas Map, Tom Green County.
TW-64	1947 Southern Tom Green County Ownership Map.
TW-10	1942 Southern Tom Green County Ownership Map.
3	1916 Map of Tom Green County.
4	1894 Map of Tom Green County (Tweedy Collection).
TW-4	1855 Survey Map of Fisher & Miller's Colony, prepared by G. Schleicher, District Surveyor for Bexar District, San Antonio, 1855.

An additional reference cited most often in Chapter 11 is an extract from a 1923-24 topographical survey map originally prepared by W. H. Griffin, R. W. Buchard, W. J. Lloyd, and H. S. Milsted from which the Twin Buttes Reservoir area was traced over for the reservoir project (copy on file, CAR-UTSA). Handwritten Survey Records are from Survey Record Books in the West Texas Collection at Porter Henderson Library, Angelo State University. Deed Records were obtained from deed books at the Tom Green County Courthouse Annex, San Angelo, Texas.

Tanya Norris, University Archivist, Angelo State University
Katie Plum, Student Assistant, West Texas Collection, Angelo State University
Preston Stone, Student Assistant, West Texas Collection, Angelo State University

Notes to Survey #1815 (41TG248):

Woodhouse, the original grantee, was a doctor who lived in Philadelphia. The property remained in his family until his grandson sold the land in 1940. Samuel Woodhouse, Jr. lived in Maine when he sold the survey to Gordon, Hall and Johnson. All of the men in the Woodhouse family were doctors.

Deed. T. R. and S. W. Woodhouse, grantee; John Lackey, grantor. March 7, 1881. Woodhouse paid Lackey $100 for the land originally granted to Sam Woodhouse that was purchased by Lackey at a tax sale for taxes due in 1877. Date: March 7, 1881. Deed Book D, page 297.

Deed. T. R. Woodhouse by extr. (Philadelphia, Trust, Safe Deposit and Insurance Co.) to Samuel Woodhouse. March 18, 1886. Deed Book Q, page 600.

S.W. Woodhouse dec'd. C/C S. W. Woodhouse last will and testament. Estate given to S.W. Woodhouse Jr. and Matilda Woodhouse, his children. November 14, 1904.

Matilda died and will filed December 29, 1926. Gave Woodhouse Survey to brother, Samuel Jr.

Deed. Samuel Woodhouse Jr. and Catherine, grantor. Kansas City, Mexico and Orient Railway Co., grantee. Easement of land 100 feet wide on each side of the track. Consideration $200. April 30, 1930. Deed Book 163, page 231.

Affidavit and Heirship. Affidavit saying S.W. Woodhouse owned survey 1815. The land was granted to his grandfather by letter patent issued by Governor Edward Clark September 1861 recorded 1867. District 11, Toby script No. 449. May 22, 1940. Deed Book 205, page 285.

Deed. Samuel Woodhouse, Jr. sold land to Ruth J. Gordon, Mary B. Hall and J. Willis Johnson. May 14, 1940. Deed Book 205, page 302.

See Figure L-2 for Surveyor's Record.

Notes to Survey #958 (41TG248):

Deed. Grantor: Franz Dorris; Grantee: Gustavus Schleicher, Date of Instrument: August 14, 1858; Date of Filing: October 17, 1859. B. R. Bexar County Records, page 106.
320 acres in Fisher Miller Colony; Schleicher bought land for $50.
Dorris died in Comal County.

No further information discovered.

Notes to Survey #811 (41TG253):

Patent. State of Texas to Gustavus Schleicher. Filed March 12, 1883. Deed Book F, page 468.

Deed. Gustavus Schleicher to Eleanor Elliott. Sold eight tracks of land on the south bank of Dove Creek and Good Spring Fork of the Concho River; including survey 811. Deed Book F, page 471.

Deed. Eleanor Elliott to Grinnell, Tweedy and Reynolds. Filed March 12, 1883. Deed Book F, page 474.

Warranty Deed, O. W. Matthews and wife to J. M. Wagstatt. Filed April 15, 1927. All of survey 811. Deed Book 128, page 429. (Matthews lived in Tarrant County and Wagstat in Taylor County.)

Release of Vendors Lien between O. W. Matthews and J. M. Wagstatt. August 8 1927. Deed Book 130, page 616.

Nothing in the index that mentioned Wagstatt after 1944. Unable to link Grinnell, Tweedy and Reynolds to Wagstatt.

Notes to Survey #656 (41TG253):

No information on H. C. White was found in the indexes up to 1920. A copy of the entry in the Surveyor's Record Book 2 is provided (Figure L-3).

See Figure L-3 for Surveyor's Record.

Notes to Survey #876 (41TG344 and 41TG459):

RELEASE OIL AND GAS LEASE
HUMBLE OIL AND REFINING CO.
THE STATE OF TEXAS TO J.W. COX
COUNTY OF HARRIS
KNOW ALL MEN BY THESE PRESENTS:

That Humble Oil and Refining Company does hereby release, remise, and relinquish unto J.W. Cox his successors and assigns, all its rights, titles, and interest in and to that certain oil, and gas mineral lease dated the 16th day of October A.D. 1937 executed by J.W. Cox as Lessor, to Gordon Kenley as Lessee, and of record in Volume

192 at page 462-65 of the Deed Records of Tom Green County, State of Texas, in so far as said lease covers and includes the following described land situated in Tom Green County, State of Texas…

QUITCLAIM DEED
STATE OF CALIFORNIA
COUNTY OF LOS ANGELES

KNOW ALL MEN BY THESE PRESENTS, that I, IRENE SPARKS, a widow of the County of Los Angeles, State of California, for and in consideration of the sum of Ten Dollars, cash in hand, paid to me by ROSE GANDY, the receipt of which I hereby acknowledge, have granted, sold, quitclaimed, and conveyed, and by these presents do grant, sell, quitclaim, and convey unto the said ROSE GANDY of Tom Green County, Texas, all of my right, title, and interest in and to all that certain tract of land which is situated in Tom Green County, Texas described as follows:

The West one-half (W. 1/2) of the following described 50 acres of land out of Survey No. 876, Adam Burkhardt, Abstract No. 64, which 50 acres is described by metes and bounds as follows:

Beginning at a stake and stone mound on East line of said Survey No. 876, at the intersection with the North line of the San Angelo and Sherwood Road; Thence North with East line of said Survey No. 876, 649 ½ varas to a stake from which a mesq. 6" bears S. 9 ¾ W. 22 varas, a do 8" bears N. 89 W. 35 varas; Thence West with South line of a 210.9 acre tract sold to Wm. Linbrugger, 426 ½ varas to a stake from which a mesq. 8" bears N. 3 ¾ E. 3 varas, a do 6" bears S. 38 W. 16 varas; Thence South 436 ½ varas to a stake from which a mesq. 6" bears S. 47 ½ E. 20 ½ varas; a do 6" bears N. 70 ½ W. 11 varas; Thence S. 31 ½ E. 404 ½ varas to a stake and stone mound on North side of the San Angelo and Sherwood road, from which a mesq. 5" bears N. 24 ¾ E. 15 ½ varas; a double mesq. 6" bears N. 10 ¼ W. 72 ½ varas; Thence N. 58 ½ E. with North line of said road, 252 varas to place of beginning.

TO HAVE AND TO HOLD all of my right, title, and interest in and to the above-described premises, together with all and singular the rights and appurtenances in anywise belonging thereto unto the said Rose Gandy, her heirs and assigns forever.

(Witnessed and signed by George W. Arnold)

Deed Book 433, pages 102–103.

DEED

I, J.W. COX of the county of Dallas, State of Texas for $10.00 and other good and valuable considerations hand paid (in cash) by IRENE SPARKS, have Granted, Sold and Conveyed… unto the said MRS. IRENE SPARKS…all that certain tract or parcel of land lying and being situated in Tom Green County, Texas, described as follows:

(*See deed transferring this land –Survey No. 876– to R. Gandy for description.)

(Witnessed on 30 April 1951 by Pat Tinkle.)

DEED

I, J.W. COX of the county of Dallas, State of Texas for $10.00 and other good and valuable considerations hand paid (in cash) by ROSE GANDY, have Granted, Sold and Conveyed… unto the said MRS. ROSE GANDY…all that certain tract or parcel of land lying and being situated in Tom Green County, Texas, described as follows:

THE WEST ONE HALF (W. ½) of the following described 50 acres of land out of Survey No. 876, Ada [sic], Burkhardt, Abstract No. 64, which 50 acres is described by metes and bounds as follows:

BEGINNING at a stake and stone mound on East line of said Survey No. 876, at the intersection with the North line of the San Angelo and Sherwood Road; THENCE North with East line of said Survey 876, 649 ½ varas to a stake from which a mesq. 6" bears S. 9 ¾ W. 22 varas, a do 8" bears N. 89 W. 35 varas; THENCE West with South line of a 210.9 acre tract sold to Wm. Linbrugger, 426 ½ varas to a stake from which a mesq. 8" bears N. 3 ¾ E. 3 varas, a do 6" bears S. 38 W. 16 varas; THENCE South 436 ½ varas to a stake from which a mesq. 6" bears S. 47 ½ E. 20 ½ varas; a do 6" bears N. 70 ½ W. 11 varas; THENCE S. 31 ½ E. 404 ½ varas to a stake and stone mound on North side of the San Angelo and Sherwood road, from which a mesq. 5" bears N. 24 ¾ E. 15 ½ varas; a double mesq. 6" bears N. 10 ¼ W. 72 ½ varas; THENCE N. 58 ½ E. with North line of said road, 252 varas to place of BEGINNING.

(Witnessed 30 April 1951 by Pat Tinkle)

AGREEMENT OF LEASE

1 January 1961:

EDITH J. MONROE leased to R.F. GANDY 40 7/10 acres out of Survey No. 875, in name of F. Decker; 42 8/10 acres out of Survey No. 876, in name of Adam Burkhardt, for a term of three years, beginning on 1 January 1961, and ending on 31 December 1963, paying $900.00 semi-annually in advance on the first day of January and on the first day of July of each year in payments of $150.00.

The premises will be used strictly for farming and ranching, and for no other purpose.

This lease shall not interfere with the rights of the Lessor to lease the property for oil or mineral purposes.

Rent shall be paid to Edith J. Monroe, 6526 Fairfield Ave. Berwyn Illinois.

Boundary Line Agreement

THIS AGREEMENT is made on this, the 12th day of October, 1961, by and between IRENE SPARKS, a widow, on the one hand, and ROSE GANDY, and her husband, R.F. GANDY, on the other hand.

WITNESSETH THAT:

WHEREAS, by deed from J.W. Cox dated April 30, 1951, and recorded in Volume 309 at page 155 of the Deed Records of Tom Green County, Texas, the west one-half of a certain fifty-acre tact out of Survey No. 876, Adam Burkhardt, Abstract No. 64, was conveyed to the said Rose Gandy which tract is more particularly described in the said deed to which reference is hereby made for all purposes; and,

WHEREAS, the said J.W. Cox, by deed dated April 30, 1951, recorded in the Deed Records of Tom Green County, Texas in Volume 309 at page 156 conveyed to the said Irene Sparks the east one-half of the said fifty-acre tract above described; and,

WHEREAS, certain questions have arisen concerning the boundary line established between the two tracts by such conveyance; which the parties hereto by these presents do mutually desire to resolve;

NOW, THEREFORE, for and in consideration of the mutual covenance hereinafter set forth, the said IRENE SPARKS, on the one hand, and the said ROSE GANDY and her husband, R.F. GANDY, on the other hand, do hereby covenant and agree that the boundary line which exists between the two tracts hereinabove described is and shall hereafter be described and recognized to be as follows:

> "BEGINNING at a point in the North right-of-way boundary of U.S. Highway No. 67 whence the intersection of the East line of the Adam Burkhardt Survey No. 876 and the North right-of-way boundary of U.S. Highway No. 67 bears North fifty eight degrees forty minutes East (N58°40'E), three hundred fifty six and one tenth (356.1) feet; Thence North twenty three degrees eleven minutes West (N23°11'W), eight hundred nineteen and seven tenths (819.7) feet; Thence North one thousand two hundred twelve and five tenths (1,212.5) feet to the North boundary of said Rose Gandy and Irene Sparks property and the South boundary of the Edith Monroe property."

(Witnesses: Irene Sparks, Rose Gandy, and R.F. Gandy)

Deed Book 433, pages 100–101.

Notes to Survey #104 (41TG443):

Land Patent
Deed Book B, page 245.
August 22, 1877
Filed September 18, 1877.

Land Patent awarded by P. H. Bell, Governor of Texas to the school Commissioners of Washington County. One league of land in Bexar County known as survey 104 in Sec. No. 14 on the west bank of the south fork of the Concho River. The NE corner of survey 102 from which a pecan bears E. ...

Lease
Deed Book S, page 422.
Date of instrument: July 7, 1886.
Date of filing: October 16, 1886.

In May 1883 C. B. Metcalfe leased four leagues of Washington Co. School Land at 13 ½ cents per acre per annum for the term of five years beginning July 1, 1888. Metcalfe agreed to pay the sum of $239.12 annually in advance. Metcalfe canceled the agreement and left a lease for the remaining term of 2 years, July 1 1886 - July 1 1888.

Beginning July 1886 Washington County leased the land to Seaton Keith for 13 ½ cents per acre. This leased land was on both sides of the Concho River. Seaton Keith agreed to use all necessary means and labor to protect and care for the timber on the said land. Lease expired July 1, 1888.

Searched indexes through 1970 and found no other Washington County entries that referred to survey 104.

See Figure L-6 for Surveyor's Record.
